

Emacs support for the Go Programming Language

Description	Keystroke	Function	Note
Go programming Language Support	Support for the Go programming language is described in this page.  Go support requires the go-mode external package.  PEL supports it when the pel-use-go-mode user option is turned on (set to t). This activates the following: <ul style="list-style-type: none">Files with the .go extensions are recognized as Go source files and use the go-mode major mode,Speedbar support for .go files listing functions and types,Automatic execution of gofmt when saving a buffer into a file,Generic programming language features like template text insertion handle Go comment style. See » Inserting Text .,Control of the tab width for all go files, via the pel-go-tab-width user-option (access the PEL customer buffer with the <f11> SPC g <f2> key sequence or <f12> <f2> from inside a buffer visiting a Go source code file.Support for syntax checking with either flymake or flycheck via the goflymake Go program. All support requires support for the Go programming language installed on your computer. <ul style="list-style-type: none">See Go installation instructions or use Homebrew's command brew install go.		
Open this PDF file. See also: » Help/Info	<f11> SPC g <f1> <f12> <f1>	(pel-help-pdf &optional OPEN-WEB-PAGE)	Open the local copy of the » - Go PDF file unless a command prefix (like C-u) was used. In that case it opens the Github-hosted file instead.
» Customize PEL Forth support	<f11> SPC g <f2> <f12> <f2>	(pel-customize-pel &optional OTHER-WINDOW)	Customize PEL Go support. <ul style="list-style-type: none">If OTHER-WINDOW is non-nil (use C-u), display in another window.
» Customize Emacs Erlang support	<f11> SPC g <f3> <f12> <f3>	(pel-customize-library &optional OTHER-WINDOW)	Customize Emacs Go support: go, go-cover, godoc, go-dot-mod. <ul style="list-style-type: none">If OTHER-WINDOW is non-nil (use C-u), display in another window.
Set tab width for current buffer	<f11> SPC g M-t <f12> M-t	(pel-go-set-tab-width N)	Change the tab width used in current buffer. <ul style="list-style-type: none">The change is temporary and affects the current buffer only.To change the tab width used for all Go source code files, change the 'pel-go-tag-width' user-option variable instead.
Toggle gofmt run on file save	<f11> SPC g M-s <f12> M-s	(pel-go-setup-info)	Display Go setup information: <ul style="list-style-type: none">tab widthwhether gofmt is executed before saving buffer.
Add new import package to list of module package import statement	C-c C-a	(go-import-add ARG IMPORT)	Add a new IMPORT to the list of imports. Don't move point. <ul style="list-style-type: none">When called with a prefix ARG asks for an alternative name to import the package as.If no list exists yet, one will be created if possible.If an identical import has been commented, it will be uncommented, otherwise a new import will be added.
Describe expression at point.	C-c C-d	(godef-describe POINT)	Describe the expression at POINT.  This uses the godef executable , a Go program. <ul style="list-style-type: none">To install it, run the following command from a shell: <code>go get github.com/rogpeppe/godef</code>.The GOPATH environment variable must be setup and GOPATH/bin must be in the PATH to be able to run godef.
Move to expression definition	C-c C-j	(godef-jump POINT &optional OTHER-WINDOW)	Jump to the definition of the expression at POINT. <ul style="list-style-type: none">after that command, use M- , to go back to original point.
Move to expression definition in other window	C-x 4 C-c C-j	(godef-jump-other-window POINT)	Jump to the definition of the expression at POINT but into the other window. <ul style="list-style-type: none">after that command, use M- , to go back to original point.
Move to current function arguments	C-c C-f a	(go-goto-arguments &optional ARG)	Go to the arguments of the current function. <ul style="list-style-type: none">If ARG is non-nil, anonymous functions are skipped.
Move to current function docstring	C-c C-f d	(go-goto-docstring &optional ARG)	Go to the top of the docstring of the current function. <ul style="list-style-type: none">If there is none, add one beginning with the name of the current function.Anonymous functions do not have docstrings, so when this is called interactively anonymous functions will be skipped. If called programmatically, an error is raised unless ARG is non-nil.
Move to function definition	C-c C-f f	(go-goto-function &optional ARG)	Go to the function definition (named or anonymous) surrounding point. <ul style="list-style-type: none">If we are on a docstring, follow the docstring down.If no function is found, assume that we are at the top of a file and search forward instead.If point is looking at the func keyword of an anonymous function, go to the surrounding function.If ARG is non-nil, anonymous functions are ignored.
Move to imports statement	C-c C-f i	(go-goto-imports)	Move point to the block of imports. <ul style="list-style-type: none">If using<pre>import ("foo" "bar")</pre>it will move point directly behind the last import.If using<pre>import "foo" import "bar"</pre>it will move point to the next line after the last import.If no imports can be found, point will be moved after the package declaration.
Move to current method receiver	C-c C-f m	(go-goto-method-receiver &optional ARG)	Go to the receiver of the current method. <ul style="list-style-type: none">If there is none, add parenthesis to add one.Anonymous functions cannot have method receivers, so when this is called interactively anonymous functions will be skipped. If called programmatically, an error is raised unless ARG is non-nil.
Move to current function name	C-c C-f n	(go-goto-function-name &optional ARG)	Go to the name of the current function. <ul style="list-style-type: none">If the function is a test, place point after 'Test'.If the function is anonymous, place point on the 'func' keyword.If ARG is non-nil, anonymous functions are skipped.
Move to current function return value declaration	C-c C-f r	(go-goto-return-values &optional ARG)	Go to the return value declaration of the current function. <ul style="list-style-type: none">If there are multiple ones contained in a parenthesis, enter the parenthesis.If there is none, make space for one to be added.If ARG is non-nil, anonymous functions are skipped.
Indent expression at point	C-M-q	(prog-indent-sexp &optional DEFUN)	Indent the expression after point. When interactively called with prefix, indent the enclosing defun instead.

Description	Keystroke	Function	Note
Go Syntax Checking Using either: <ul style="list-style-type: none"> flycheck or flymake 	Syntax checking for the Go programming language can be done with Emacs built-in flymake as well as with the  external package flycheck .  <ul style="list-style-type: none"> To activate either set the pel-use-goflymake user option is set to either 'use-flycheck or 'use-flymake. By default, the syntax checker is not automatically launched. If you want to start your selected syntax checker as soon as a .go file is opened, add 'go-mode to the pel-modes-activating-syntax-check user-option.  PEL automatically installs and activates flycheck when pel-use-goflymake user option is set to 'use-flycheck. flymake is built-in Emacs.  Support for those is provided by the external go-flymake.el and go-flycheck.el files.  PEL downloads and install them when pel-use-goflymake user option is set to either 'use-flycheck or 'use-flymake. These 2 packages use the goflymake Go program, which must be installed separately. <ul style="list-style-type: none"> To install the goflymake executable do the following: <ul style="list-style-type: none"> Install Go on your computer if this is not already done. See instruction at the top of this page. Set the GOPATH for your project. Run the following command: go get -u github.com/dougmg/goflymake <ul style="list-style-type: none">  The above command will get goflymake source and install the goflymake executable file inside the bin directory of your Go project identified by the GOPATH. You will probably want to edit code in <i>several</i> Go projects, so it might be a good idea to either copy or create a symlink in one of the directories in your PATH to that file, allowing you to change GOPATH and continue to use the goflymake binary. 		
Activate/deactivate selected syntax checker	<div><f11> SPC g !</div> <div><f12> !</div>	<div>(pel-go-toggle-syntax-checker)</div>	Toggle the selected Go syntax checker mode on/off. <ul style="list-style-type: none"> The syntax checker activated or deactivated is either flycheck or flymake, as selected by the user-option variable pel-use-goflymake.   See the required settings above to activate this command and select the syntax checker.
