

Keys with Super modifier keys (⌘ on macOS)

macOS Key	Mac OS Terminal	Emacs in Terminal mode	Emacs in Graphics mode
Special key: Clear	<p>The Apple keyboards with numeric keypad have a Clear key. That key is located at the top left of the numeric keypad at the position where the numlock key is often located in other keyboards.</p> <p>Over the years Apple manufactured keyboards with this key with different labels: clear and  are the most often seen labels. See here and here.</p> <p>Names: Clear, CLR, CLS Symbol:  Mac symbol:  Key Code: 0x47</p> <p>The documented purpose of the Clear key is to clear the selected content but is application dependent. For instance:</p> <ul style="list-style-type: none"> Inside spreadsheet programs (like macOS Numbers and Excel) it clears the content of currently selected cells. It also clears the content of currently selected text. Inside macOS Finder it selects the file with the name alphabetically sorted last. Inside macOS Terminal.app it can be configured to act as a Numlock key in the Profiles keyboard list. I have not yet found a way to map it in iTerm2. I posted a question in StackExchange AskDifferent while I continue the investigation. <ul style="list-style-type: none"> It is possible to map specific keys of the numeric keypad but the Clear key registers as Numlock right away. 		
<clear>			
<ul style="list-style-type: none"> macOS Keyboard Shortcuts Terminal Keyboard Shortcuts 	<p>This table list the macOS specific key and their meaning as well as the bindings and availability inside Emacs running in terminal (TTY) mode and in graphics mode.</p> <p>The keys marked macOS key are reserved to macOS and are user configurable in macOS System Preferences.</p> <p>See also: 🍏 macOS Fct Keys</p>
