

Key-Chords & Key-Seq

Action	Keystroke	Function	Note
Two Characters <ul style="list-style-type: none"> key-chord, or key-seq <p>See also: 🔗 Customize</p>	<p>PEL supports the use of key chords: two keys typed at the same time to invoke a specific command.</p> <ul style="list-style-type: none">  This requires the key-chord external package  PEL activates it with the pel-use-key-chord user-option set to t or to use-from-start, PEL activates the global and mode-specific key chord bindings identified in the pel-key-chords user option. If pel-use-key-chord is set to use-from-start it activates the key-chords when Emacs starts, otherwise you must first activate the key-chord mode with the key-chord-mode command which PEL maps to the keystroke <f11> <f5> k k.  The key-seq external package  activated by pel-use-key-seq user option set to t, allows creation of key-chords as key-seq sequences. <ul style="list-style-type: none"> The key-seq sequences impose a key order for detection which might help fast typists; if you define “4r” as you key-seq sequence it will only trigger the action if you type ‘4’ then ‘r’ quickly. Typing the ‘r’ then the ‘4’ quickly will not trigger the action.  Note, however that key sequences defined with key-seq must only use ASCII characters in the decimal range of [32,126]. This means you cannot use control characters in key-seq sequences. For key-chord sequences you can use ASCII control characters; to include them in the 2 character sequence when editing you key-chord in the pel-key-chords, type C-q followed by the control key. For example type C-q C-i to insert a tab.  PEL provides a set of pre-defined key-chords in the pel-key-chords user option and maps the the <f11> <f5> k <f2> to quickly access the PEL key-code customize buffer. and edit these values. You can add, delete or edit any of the provided key-chords, which provide examples of the ways to define your own key-chords. The list of key-chords PEL pre-defines and provides as default are show in the rows below. A key chord is a group of 2 normal, non-modifier keys that must be typed simultaneously to activate the action identified in the key chord definition. <ul style="list-style-type: none"> Here, we are not talking of something like the normal Emacs key bindings like C-s, where the Control key and the s key are type together to do a CONTROL-S or where M-b represents using the Meta key and the b key together. The key-chords discussed here allow you to define actions when you type, for example, the key ‘j’ and the key ‘k’ together, or when you type the ‘.’ key twice quickly. <i>When the key-chord-mode is active</i> these special key-chord events are triggering the action you key-chord definition identifies. If the key-chord-mode is off, you get the normal Emacs behaviour of inserting the two keys inside the current buffer at point location.  PEL also provides the following control user options for key-chords and key-seq: <ul style="list-style-type: none"> pel-key-chord-two-keys-delay: Max time delay between two key press to be considered a key chord. pel-key-chord-one-key-delay: Max time delay between 2 press of the same key to be considered a key chord. This should normally be a little longer than ‘key-chord-two-keys-delay’. pel-key-chord-in-macros: If nil, don’t expand key chords when executing keyboard macros. If non-nil, expand chord sequences in macros, but only if a similar chord was entered during the last interactive macro recording. (This carries a bit of guesswork. We can’t know for sure when executing whether two keys were typed quickly or slowly when recorded.)  Switching input-method (as described in 🔗 Input Method) prevents key-chord from working properly. <ul style="list-style-type: none"> To fix the problem: toggle the key-chord-mode off and back on. 		
Open this PDF file. See also: 🔗 Help/Info	<f11> <f5> k <f1>	(pel-help-pdf &optional OPEN-WEB-PAGE)	Open the 🔗 Key-Chords local PDF. If the prefix argument (like C-u or M--) is used, then it opens the remote GitHub hosted raw PDF instead. If the pel-flip-help-pdf-arg user-option is set it’s the other way around.
🔗 Customize PEL key-chord control	<f11> <f5> k <f2>	(pel-cfg-pkg-key-chord &optional OTHER-WINDOW)	Customize PEL Key Chord support. <ul style="list-style-type: none"> If OTHER-WINDOW is non-nil (use C-u), display in another window.
🔗 Customize Emacs key-chord control	<f11> <f5> k <f3>	(pel-customize-library &optional OTHER-WINDOW)	Customize Emacs support for: key-chord <ul style="list-style-type: none"> If OTHER-WINDOW is non-nil (use C-u), display in another window.
PEL Key-chords	<p>The following rows describe the key-chords PEL defines by default in the pel-key-chords user option.</p> <ul style="list-style-type: none"> You can use them when the key-chord-mode is active. You can also decide to change them if they do not suit you, delete or add new ones by customizing the pel-key-chords user option. PEL provides a key binding to quickly access the customize buffer for key-chord control: <f11> <f2> P M-K The pel-key-chords user option has complete docstring that describes how to add news values. 		
Toggle key-chord mode	<f11> <f5> k k	(key-chord-mode ARG)	Toggle key chord mode. <ul style="list-style-type: none"> With positive ARG enable the mode. With zero or negative arg disable the mode. A key chord is two keys that are pressed simultaneously, or one key quickly pressed twice.  Requires key-chord  PEL activates it with pel-use-key-chord .
Show state of key-chord mode	<ul style="list-style-type: none"> <f11> <f5> k ? <f11> ? k M-K 	(pel-key-chord-describe)	Show state of key-chord-mode. When key-chord mode is on, list key chord bindings in a help buffer. See also: 🔗 Help/Info
PEL Pre-defined key-chords	<ul style="list-style-type: none"> PEL default for pel-key-chords are identified in the tables of this document with the characters underlined. In some cases the key-chord is a simple binding to execute a command or an Emacs Lisp lambda form. In that case the 2 key-chord keys are shown in the keystroke column alone, simply underlined. In other cases, the key-chord inserts characters and execute commands. In such as case, the 2 key-chord keys are also shown in the keystroke column alone, but instead of describing the function in the function column, the cell shows the key-chord string which represent both the character inserted and the key code for the command. <ul style="list-style-type: none"> For example, the key-chord that consist of typing the < key and the > key together is represented as the <> key-chord and the expansion is show as “<>\C-b” . The effect is to insert both angle brackets and put point in between, since C-b is bound to to command backward-char. The color of the key-chord corresponds to the availability of the commands used, if any. A key-chord that depends only on Emacs standard commands or simple characters is therefore shown in black.  PEL pre-defined key-chords are key-chords, not key-seq. Note that key-seq cannot use tab the way it is used for pel-indent-rigidly below.  With key-chord or key-seq defined as lambdas, you can pass arguments to the called command, just as any other key binding. <ul style="list-style-type: none"> You can control whether a key-chord is allowed in a read-only buffer for example, and/or pass numeric arguments. PEL uses this ability in the definitions of the key-chords using pel commands but it could be applied to anything defined with a lambda. 		
Insert <> and place point between them	<>	<>\C-b	Global: available in all modes.
Insert [] and place point between them	[]	[]\C-b	Global: available in all modes.
Insert {} and place cursor between	{ }	{ \n\n }\C-p\C-p	Available in c-mode and c++-mode
Move to window above	yu	(windmove-up &optional ARG)	Select the window above the current one. <ul style="list-style-type: none"> With no prefix argument, or with prefix argument equal to zero, "up" is relative to the position of point in the window; otherwise it is relative to the left edge (for positive ARG) or the right edge (for negative ARG) of the current window. If no window is at the desired location, an error is signaled. Global: available in all modes.
Move to window below	bn	(windmove-down &optional ARG)	Select the window below the current one. <ul style="list-style-type: none"> With no prefix argument, or with prefix argument equal to zero, "down" is relative to the position of point in the window; otherwise it is relative to the left edge (for positive ARG) or the right edge (for negative ARG) of the current window. If no window is at the desired location, an error is signaled. Global: available in all modes.
Move to window at left	gf	(windmove-left &optional ARG)	Select the window to the left of the current one. <ul style="list-style-type: none"> With no prefix argument, or with prefix argument equal to zero, “left” is relative to the position of point in the window; otherwise it is relative to the top edge (for positive ARG) or the bottom edge (for negative ARG) of the current window. If no window is at the desired location, an error is signalled. Global: available in all modes.
	 This key chord might be problematic for programming or writing English text. Using key-seq will help, as you will have to type the letter ‘g’ before the letter ‘f’. To remove its customize value: use <f11> <f5> k <f2> .		

Key-Chords — References

Topic & Link	Description
Emacs normal key sequences	Emacs supports binding commands to key sequences of your choice. In the sequence you can have keys that are typed along with one or several key modifiers (Control, Meta, Super, Hyper, Alt) and you can use several keys: the first set(s) being used as key prefixes.
Key Sequences @ EmacsWiki	Describes what a normal/standard Emacs key sequence is.
Key-Chord extension package	The key-chord package provides the ability to unbind commands to an event consisting of typing 2 keys simultaneously, those keys not using key modifiers. For example you could bind a command to pressing the '4' and the 'r' key simultaneously.
key-chord @ MELPA	This page shows the doc coming from the key-chord.el. It's where PEL gets the file from.
Key Chords @ Emacs Wiki	Some interesting discussion about key-chord.
key-chord.el @ Emacs Wiki	
Key-Set extension package	<p>The key-seq package builds on key-chord package. It changes the way simultaneous keys are detected and imposes an order to these keys. So for a key-seq of "jk" it only accepts the keys if 'j' is type before and 'k' is typed quickly following it. Depending of your typing skills this may help reduce the unwanted triggers of key chords.</p> <p>PEL supports both key-chord and key-seq to the level where you can define a mix of bindings: they can be key-chord or key-seq bindings.</p>
