## Perl scripts

Writing Perl scripts				
Use the following at the beginning of Perl script files.	<code><a href="#">#!/usr/bin/perl</a> <a href="#">use strict</a>; <a href="#">use warnings</a>; <a href="#">use diagnostics</a>;</code>	<ul style="list-style-type: none"> <li>The first line of an executable script should be a valid <a href="#">shebang line</a> identifying the appropriate location of the Perl interpreter.</li> <li>Most Perl code should also activate the strict Perl rules and warnings to detect warnings.                             <ul style="list-style-type: none"> <li>See: <a href="#">Barewords in Perl</a></li> </ul> </li> <li>If you want to produce more diagnostics for detected warning or errors then add the 'use diagnostics;' line.</li> </ul>		
<a href="#">use version/features</a>	<code><a href="#">use</a> v5.36;</code>	This can be used to enable both the strict and warning pramas as well as several <a href="#">named features</a> . <ul style="list-style-type: none"> <li>See the <a href="#">table listing the feature bundles per Perl versions</a>.</li> </ul>		

## Perl 5 Operators

Perl 5 Operators		Perl has a large number of operators, listed below with their <b>precedence and associativity</b> .	
Note:		<ul style="list-style-type: none"><li>• <a href="#">C Operators missing from Perl</a> : unary &amp;, unary * and (type)</li><li>• <a href="#">Quote and Quote-like operators</a> : in Perl quotes are operators and they provide various kind of interpolating and pattern matching capabilities.</li></ul>	
<b>Associativity:</b> one of: <ul style="list-style-type: none"><li>• right</li><li>• left</li><li>• NA : not associative: cannot use more than one of these operators in sequence.</li><li>• CH: chained</li></ul> To get this information, use: <b>perldoc perlop</b>	left	<a href="#">terms and list operators (leftward)</a>	
	left	<a href="#">Arrow Operator:</a>	->
	NA	<a href="#">Auto-increment and Auto-decrement:</a>	++ --
	right	<a href="#">Exponentiation:</a>	**
	right	<a href="#">Symbolic Unary Operators:</a>	! ~ -. \ and unary + and -
	left	<a href="#">Binding operators:</a>	-- !~
	left	<a href="#">Multiplicative Operators:</a>	* / % x
	left	<a href="#">Additive Operators:</a>	+ - .
	left	<a href="#">Shift Operators:</a>	<< >>
	NA	<a href="#">named unary operators</a>	
	NA	<a href="#">Class instance Operator:</a>	isa
	CH	<a href="#">Relational Operators:</a>	as numbers: < > <= >= as strings: lt gt le ge
	CH/NA	<a href="#">Equality Operators:</a>	as numbers: == != <=> as strings: eq ne cmp --
	left.	<a href="#">Bitwise And:</a>	& &.
	left	<a href="#">Bitwise Or and Exclusive Or:</a>	. ^ ^.
left	<a href="#">C-style Logical And:</a>	&&	
left	<a href="#">Logical Defined-Or:</a>	^^ //	
NA	<a href="#">Range Operators:</a>	.. ...	
right	<a href="#">Conditional Operator:</a>	?:	
right	<a href="#">Assignment Operators:</a>	=	
		**= += *= &= &.= <<= &&=	
		-= /=  =  .= >>=   =	
		.= %= ^= ^.= //=	
		x=	
		goto last next redo dump	
left	<a href="#">Comma, fat-comma Operators:</a>	, =>	
NA	<a href="#">list operators (rightward)</a>		
right	<a href="#">Logical Not:</a>	not	
left	<a href="#">Logical And:</a>	and	
left	<a href="#">Logical or and Exclusive or:</a>	or xor	
File test operators			
It is possible to combine the file test operator with the AND operator as in the following example:			
<pre>if (-e \$fname &amp;&amp; -f _ &amp;&amp; -r _ ){     print("\$fname exists and is readable\n"); }</pre>			
The most important operators are shown here. They check if the file...	<b>-r</b>	is readable	<b>-e</b> exists.
	<b>-w</b>	is writable	<b>-z</b> is empty.
	<b>-x</b>	is executable	<b>-s</b> has nonzero size (returns size in bytes).
	<b>-o</b>	is owned by effective uid.	<b>-f</b> is a plain file.
	<b>-R</b>	is readable	<b>-d</b> is a directory.
	<b>-W</b>	is writable	<b>-l</b> is a symbolic link.
	<b>-X</b>	is executable	<b>-p</b> is a named pipe (FIFO) or Filehandle is a pipe.
	<b>-O</b>	file is owned by real uid.	<b>-S</b> is a socket.
			<b>-b</b> is a block special file.
			<b>-c</b> is a character special file.
			<b>-t</b> handle is opened to a tty.
			<b>-u</b> has setuid bit set.
			<b>-g</b> has setgid bit set.
			<b>-k</b> has sticky bit set.
			<b>-T</b> is an ASCII text file (heuristic guess).
			<b>-B</b> is a “binary” file (opposite of -T).

Perl 5 Constants and Variables

Perl Sigils	Sigil	Examples	Meaning	Extra Info	
Scalar	\$	\$foo \$days[28] \$days{'Feb'} \${days} \$Dog::days \$Dog'days \$#days \$days->[28] \$days[0][2] \$d{99}{'Feb'} \$d{99, 'Feb'}	Simple scalar value 29 <sup>th</sup> element of array @days Value associated with the <i>Feb</i> key of hash %days Same as \$days, but unambiguous before alphanumerics. Useful inside strings for interpolation of variables followed by other letters. The \$days variable inside the Dog package. Same as above. However this is an archaic use of the single quote. Last index of array @days. 29 <sup>th</sup> element of array pointed to by reference \$days. Multi-dimensional array Multi-dimensional hash Multi-dimensional hash emulation		
Array	@	@days @days[3,4,5] @days[3..5] @days{'J','F'}	Array containing (\$days[0], \$days[1], ... \$#days[\$#days]) . Array slice containing (\$days[3], \$days[4], \$days[5]) . Array slice containing (\$days[3], \$days[4], \$days[5]) . Hash slice containing (\$days{'J'}, \$days{'F'}) .		
Hash/associative array	%	%days	Associative array (hash): keys-value pairs. Can be initialized as: • %days = (Jan => 31, Feb => \$leap? 29 : 28, ...) • %days = ("Jan, 31, 'Feb', \$leap? 29 : 28, ... )		
Subroutine	&	&foo	& is needed to create reference to subroutine.		
Typeglob	*	*foo	See: <a href="#">Advanced Perl Programming</a> , 1st Edition Section 3.2		
Scalar values			Numeric literals examples	Useful related builtin functions	
• <b>numeric:</b>	• integer : using the system's native format. • <b>bigint</b> - transparent big integer support. • <b>bignum</b> - transparent big number support. • floating-point : using the system's native format. • <b>bigrat</b> - transparent big rational number support.		my \$x = 12345; # integer my \$x = 12345.67; # floating point my \$x = 6.02e23; # scientific notation my \$x = 4_294_967_296; # underline for legibility my \$x = 0377; # octal my \$x = 0xffff; # hexadecimal my \$x = 0b1100_0010; # binary	• <b>oct</b> • <b>hex</b> • <b>POSIX::ceil</b> • <b>POSIX::floor</b> • <b>abs</b>	
• <b>string</b>	• double-quoted strings: perform backslash and variable interpolation of expression that begin with \$ (a scalar) or @ (an array). Hashes cannot be interpolated. • single-quote strings: only perform \ ' and \\ substitution (to ' and \ respectively), nothing else.				
• <a href="#">Quote constructs</a>	Customary	Generic	Meaning	Interpolates?	Notes
See: • <a href="#">Strings in Perl: quoted, interpolated and escaped</a>	' ' "" ` ` ( ) // s/// tr/// ""	q// qq// qx// qw// m// s/// y/// qr//	Literal string Literal string Command execution World list Pattern match Pattern substitution Character translation Regular expression	No Yes Yes No Yes Yes No Yes	• Not all characters can be used as the / separator. { }, ( ) and < > can also be used. • You can use whitespace between the quote specifier and its initial bracketing character: my \$chuck_of_code = q { if (\$condition) { print "Salut!"; } }; • It's also possible to write: s<foo>(bar) and tr(a-f)[A-F] as well as: tr(a-f)[A-F]; • Array variables are interpolated by joining all elements with the separator specified by the \$* special variable (\$LIST_SEPARATOR) .
• <b>Character escapes</b>	\a \b \e \f \n \r \t	Alert (bell) Backspace ESC character Form feed Newline (usually LF) Carriage return (Usually CR) Horizontal tab	\e \033 \o{33} \x7f \x{263a} \cC	ESC character ESC in octal ESC in octal DEL in hexadecimal Character number 0x263A Control-C	\N{LATIN SMALL LETTER E WITH ACUTE} é \N{ U+E9 } é
• <b>translation escapes</b>	\u \l	Force next character to titlecase Force next character to lowercase	\U \L \F \Q	Force all following characters to uppercase. Ends at \E Force all following characters to lowercase. Ends at \E Force all following characters to fold case. Ends at \E Backslash all following non alphanumeric characters. Ends at \E	\E Ends \U, \L, \F or \Q
• <a href="#">bareword</a>	In Perl, a <i>bareword</i> refers to a sequence of characters suitable for an identifier. It's not quoted. By default Perl allows barewords to behave like strings. • This is not allowed when any of <b>use strict;</b> or <b>use strict "subs";</b> or <b>use v5.12;</b> is specified.				
• <a href="#">Here documents</a> • <a href="#">Here docs @ Perl maven</a>	Perl here-documents are a form of line oriented quoting. There are several forms of here documents, where the identifier (like EOF used below, but can be any word) must be placed at the beginning of the terminating line: • <b>Default :</b> <<EOF; Supports variable interpolation. • <b>Double quotes:</b> <<"EOF"; Supports variable interpolation. Can also be written with whitespace as in <<"EOF"; • <b>Single quotes:</b> <<'EOF'; Does not support interpolation. Can also be written with whitespace as in <<'EOF'; • <b>backticks:</b> <<'EOF'; Execute commands in a shell and return text printed on stdout. Can also be written with whitespace as in <<'EOF'; • <b>indented:</b> <<~EOF; Allows indenting the here-doc string. Can also use the ~ with the other forms: <<~\EOF, <<~"EOF", <<~"EOF", <<~'EOF' • They can also be stacked and text can be transformed. See the documentation.				
• <a href="#">Perl Regexp</a> info, cheatsheets & regexp testers	• <b>Regexp Tutorial</b> • <b>Learn PCRE in X minutes</b>		• <a href="#">PCRE cheatsheet</a>		• <a href="#">Debuggex</a> regexp tester • <a href="#">regex101</a> • <a href="#">RegEx Pal</a>
Perl Constants					
• <a href="#">Perl pragma to declare constants</a> . ⚠️ But be aware that these are still not read-only, that they inject sub-routines and have several limitations. Read the doc!! • <a href="#">CPAN modules for defining constants by Neil Bowers</a> . Of particular interest: <b>Const::Fast</b> and <b>Attribute::Constant</b> for efficient read-only constants.					
Perl Variables Names		Scalar Naming Conventions		Array Naming Conventions	
👉 Case is significant in all names.	• Local variables: \$lowercase • Global variables: \$Title_Case • Constants: \$UPPER_CASE • All variables: words separated by underscores.		Similar conventions, except that array names should be <b>plural</b> . • @locals • @Global_Arrays • @CONSTANT_ARRAYS		
Perl Special Variables					
• <a href="#">Perl Variables</a>	👉 To get information about a Perl special variable from the command line use the <b>perl-doc -v</b> command. • To get information about \$< use: <b>perl-doc -v '\$&lt;'</b>				
• <a href="#">General variables</a>					
default input and pattern searching space	• \$ARG • \$_		subroutine parameters		• @ARG • @_
list separator	• \$LIST_SEPARATOR • \$"		Subscript separator for multidimensional array emulation		• \$\$SUBSCRIPT_SEPARATOR • \$SUBSEP • \$;
Name of executed program	• \$PROGRAM_NAME • \$0		Name used to execute the current copy of Perl		• \$EXECUTABLE_NAME • \$^X
Perl process ID	• \$PROCESS_ID • \$PID • \$\$				
Process real GID	• \$REAL_GROUP_ID • \$GID • \$(		Process effective GID		• \$EFFECTIVE_GROUP_ID • \$EGID • \$)

Process real UID	<ul style="list-style-type: none"><li>\$REAL_USER_ID</li><li>\$UID</li><li>\$&lt;</li></ul>		Process effective UID	<ul style="list-style-type: none"><li>\$EFFECTIVE_USER_ID\$</li><li>\$EUID</li><li>\$&gt;</li></ul>	
Special variables in sort	<ul style="list-style-type: none"><li>\$a</li><li>\$b</li></ul>		Example: by default Perl sort function sorts strings. Pass a sorting function that uses the <=> equality operator to force numerical comparisons: <code>@sorted = sort { \$a &lt;=&gt; \$b } @unsorted;</code>		
Current environment	%ENV		Environment variable accessed as an associative array (a hash). <ul style="list-style-type: none"><li>See: Perl: <a href="#">How to access shell environment variables through Perl associative arrays.</a></li></ul>		
Perl interpreter revision, version and subversion	<ul style="list-style-type: none"><li>\$OLD_PERL_VERSION</li><li>\$]</li></ul>		Perl interpreter revision, version and subversion	<ul style="list-style-type: none"><li>\$PERL_VERSION</li><li>\$^V</li></ul>
