

Emacs support for Make Files

Description	Keystroke	Function	Note
Make support	This table describes Emacs support for editing make files.		
Open this PDF file. See also: ⓘ Help/Info	<f11> SPC M <f1>  <f12> <f1>	(pel-help-pdf &optional OPEN-WEB-PAGE)	Open the local copy of the ⓘ - Make PDF file unless a command prefix (like C-u) was used. In that case it opens the Github-hosted file instead.
ⓘ - Make	<f11> SPC M <f3>  <f12> <f3>	(pel-customize-library &optional OTHER-WINDOW)	Customize Emacs makefile support: makefile. • If OTHER-WINDOW is non-nil (use C-u), display in another window.
Select Make dialect mode	Emacs supports several dialects of make. It automatically selects the dialect when a file is visited using the mode and file specification association identified in the auto-mode-alist variable. • PEL provides the pel-auto-mode-alist user-option variable to allow you to specify associations in your customization if the defaults provided by Emacs does not work for you. You can access the customization buffer for this user-option by using the customize-option command which PEL binds to <f11> <f2> o. Use it and then type the name of the user-option. Add a file parent regex and the name of the mode you require, one of: <ul style="list-style-type: none"><li>makefile-mode</li><li>makefile-automake-mode</li><li>makefile-bsdmake-mode</li><li>makefile-gmake-mode</li><li>makefile-makepp-mode</li></ul> You can also use the following commands to manually activate one of these modes when on of them is already active.		
Activate automake mode	• C-c RET C-a • C-c C-m C-a	(makefile-automake-mode)	Acivates the automake mode • The mode-line lighter is : Makefile.am
Activate BSD make mode	• C-c RET C-b • C-c C-m C-b	(makefile-bsdmake-mode)	Activates the BSD make mode. • BSD Make is the default make on macOS and BSD OS systems. • The mode-line lighter is : BSDmakefile
Activate GNU make mode	• C-c RET C-g • C-c C-m C-g	(makefile-gmake-mode)	Activates the GNU make mode. • The mode-line lighter is : GNUmakefile
Activate imake mode	• C-c RET <tab> • C-c C-m C-i	(makefile-imake-mode)	Activate the imake mode • The mode-line lighter is : Imakefile
Activate standard make mode	• C-c RET RET • C-c C-m C-m	(makefile-mode)	Activates the major mode for editing standard Makefiles. • The mode-line lighter is : Makefile
Activate makepp mode	• C-c RET C-p • C-c C-m C-p	(makefile-makepp-mode)	Activates the makepp mode. Also called make++ • makepp is written in Perl. It is mostly useful for writing C++ specific make files, as it expands GNU Make and removes the requirement of using recursive make. • The mode-line lighter is : Makeppfile
Navigate	The standard Emacs make-mode.el package provides the 2 commands to navigate across make target/dependency statements. PEL complements this with commands to navigate across the macro definition statements.		
Move point forward to next target/dependency	• M-n • <f12> <down> • <M-f12> <down>  <f11> SPC M <down>	(makefile-next-dependency)	Move point to the beginning of the next dependency line. • Skips comments and macro definitions.
Move point backward to previous target/dependency	• M-p • <f12> <up> • <M-f12> <up>  <f11> SPC M <up>	(makefile-previous-dependency)	Move point to the beginning of the previous dependency line. • Skips comments and macro definitions.
Move point forward to next macro definition statement	• <f12> <M-down> • <M-f12> <M-down>  <f11> SPC M <M-down>	(pel-make-next-macro &optional N SILENT DONT-PUSH-MARK)	Move to the beginning of next N make file macro definition statement. • The function skips over comments. • If no valid form is found, don't move point, issue an error describing the failure unless SILENT is non-nil, in which case the function returns nil on error and non-nil on success. • The error message states the number of instanced searched, the regexp used and the number of instances found. • On success, the function push original position on the mark ring unless DONT-PUSH-MARK is non-nil. • The command support shift-marking.
Move point backward to previous macro definition statement	• <f12> <M-up> • <M-f12> <M-up>  <f11> SPC M <M-up>	(pel-make-previous-macro &optional N SILENT DONT-PUSH-MARK)	Move to the beginning of previous N make file macro definition statement. • The function skips over comments. • If no valid form is found, don't move point, issue an error describing the failure unless SILENT is non-nil, in which case the function returns nil on error and non-nil on success. • The error message states the number of instanced searched, the regexp used and the number of instances found. • On success, the function push original position on the mark ring unless DONT-PUSH-MARK is non-nil. • The command support shift-marking.
Insert & Edit	The following commands help the editing of the makefile contents.		
Insert GNU make function statement	• C-c Tab • C-c C-i	(makefile-insert-gmake-function)	Insert a GNU make function call. • Asks for the name of the function to use (with completion). • Then prompts for all required parameters.
Insert target at point	C-c :	(makefile-insert-target-ref TARGET-NAME)	Complete on a list of known targets, then insert TARGET-NAME at point.
Add/remove line continuation trailing backslashes	C-c C-\	(makefile-backslash-region FROM TO DELETE-FLAG)	Insert, align, or delete end-of-line backslashes on the lines in the region. • With no argument, inserts backslashes and aligns existing backslashes. • With an argument, deletes the backslashes. This function does not modify the last line of the region if the region ends right at the start of the following line; it does not modify blank lines at the start of the region. So you can put the region around an entire macro definition and conveniently use this command.
Perform completion at point	C-M-i	(completion-at-point)	Perform completion on the text around point. The completion method is determined by 'completion-at-point-functions'. ⚠️🔧 This is also often found to flyspell command.
Indenting	In make file editing, the tab character is important. The make program distinguish the tab character from multiple space characters. ⚠️The C-M-q key sequence is bound to prog-indent-sexp but it does not work well in makefile. Use the other 3 commands.		
Insert a tab character	<tab>	(indent-for-tab-command &optional ARG)	Inserts a tab character in a makefile.
Indent line(s) rigidly	• <f6> <tab> • <f11> <tab> c	(pel-indent-lines &optional N)	Indent current or marked lines by N indentation levels. Each level uses a tab character. • Works with point anywhere on the line. • All lines touched by the region are indented. • A special argument N can specify more than one indentation level. It defaults to 1. • If a negative number is specified, 'pel-unindent-lines' is used. • If a region is marked, the function does not deactivate it to allow repeated execution of the command. It also modifies the region to include all characters in all affected lines. • Use C-g to de-activate the region.

Description	Keystroke	Function	Note
Un-indent line(s) rigidly	<ul style="list-style-type: none"> <li>&lt;backtab&gt;</li> <li>&lt;f6&gt; &lt;backtab&gt;</li> <li>&lt;f11&gt; &lt;tab&gt; C</li> </ul>	(pel-unindent-lines &optional N)	<ul style="list-style-type: none"> <li>Un-indent current line or marked lines by N indentation levels.</li> <li>Works with point is anywhere on the line.</li> <li>All lines touched by the region are un-indented.</li> <li>If region was marked, the function does not deactivate it to allow repeated execution of the command.</li> <li>If a region was marked, the function does not deactivate it to allow repeated execution of the command. It also modifies the region to include all characters in all affected lines</li> <li>Use <b>C–g</b> to de-activate the region.</li> </ul>
Indent expression	<b>C–M–q</b>	(prog-indent-sexp &optional DEFUN)	Indent the expression after point. <ul style="list-style-type: none"> <li>When interactively called with prefix, indent the enclosing defun instead.</li> </ul> ⚠ This command does not work well in makefiles.
Comment control	Although the make file modes provide the comment-region command, it's best to use comment-dwim as it works much better.		
Comment/un-comment  See also: <a href="#">Comments</a>	<b>M–;</b>	(comment-dwim ARG)	Comment or un-comment line or region. <ul style="list-style-type: none"> <li>When no marked region and no comment:               <ul style="list-style-type: none"> <li>On empty line: insert comment starter at the proper indentation level. Typed again: move it toward end of line.</li> <li>On line with code: insert comment starter after the code for an end-of-line comment</li> </ul> </li> <li>With marked un-commented region:               <ul style="list-style-type: none"> <li>Comment region (each line is commented)</li> </ul> </li> <li>With marked commented region:               <ul style="list-style-type: none"> <li>removes the comment.</li> </ul> </li> <li>Call the comment command you want (Do What I Mean).               <ul style="list-style-type: none"> <li>If the region is active and 'transient-mark-mode' is on, call 'comment-region' (unless it only consists of comments, in which case it calls 'uncomment-region'). Else, if the current line is empty, call 'comment-insert-comment-function' if it is defined, otherwise insert a comment and indent it. Else if a prefix ARG is specified, call 'comment-kill'. Else, call 'comment-indent'.</li> </ul> </li> </ul>
	<b>C–c C–c</b>	(comment-region BEG END &optional ARG)	Comment or uncomment each line in the region. <ul style="list-style-type: none"> <li>With just C-u prefix arg, uncomment each line in region BEG .. END.</li> <li>Numeric prefix ARG means use ARG comment characters.</li> <li>If ARG is negative, delete that many comment characters instead.</li> <li>The strings used as comment starts are built from 'comment-start' and 'comment-padding'; the strings used as comment ends are built from 'comment-end' and 'comment-padding'.</li> <li>By default, the 'comment-start' markers are inserted at the current indentation of the region, and comments are terminated on each line (even for syntaxes in which newline does not end the comment and blank lines do not get comments). This can be changed with 'comment-style'.</li> </ul> ⚠ Prefer comment-dwim: it works better.
Analyze	The following commands analyze the content of the make file or the file system.		
Scan current directory files, checking for targets	<b>C–c C–f</b>	(makefile-pickup-filenames-as-targets)	Scan the current directory for filenames to use as targets. <ul style="list-style-type: none"> <li>Checks each filename against 'makefile-ignored-files-in-pickup-regex' and adds all qualifying names to the list of known targets.</li> </ul>
Scan current buffer for makefile content	<b>C–c C–p</b>	(makefile-pickup-everything ARG)	Notice names of all macros and targets in Makefile. <ul style="list-style-type: none"> <li>Prefix arg means force pickups to be redone.</li> </ul> Use this to refresh the list of macros and targets located in the makefile before executing another action on those.
Update scan with latest makefile buffer content	<b>C–c C–u</b>	(makefile-create-up-to-date-overview)	Create a buffer containing an overview of the state of all known targets. <ul style="list-style-type: none"> <li>Known targets are targets that are explicitly defined in that makefile; in other words, all targets that appear on the left hand side of a dependency in the makefile.</li> </ul>
List macros and targets in dedicated buffer	<b>C–c C–b</b>	(makefile-switch-to-browser)	Open a "Macros and Target" buffer that only lists them. <ul style="list-style-type: none"> <li>It operates in Fundamental mode and aside listing the macros and targets provides nothing more.</li> </ul>
