

Counting Elements

Operation	Keystroke	Function	Note
Counting in Buffers	Emacs provide a set of commands to count elements inside buffers.		
Open this PDF file. See also: ⌘ Help/Info	<f11> c <f1>	(pel-help-pdf &optional OPEN-WEB-PAGE)	Open the ⌘ Counting local PDF. If the prefix argument (like C-u or M--) is used, then it opens the remote GitHub hosted raw PDF instead. If the pel-flip-help-pdf-arg user-option is set it's the other way around.
Counting Elements	The following commands count things in the current buffer.		
Count the lines on the current page & display the current line	<ul style="list-style-type: none"> C-x 1 <f11> c p 	(count-lines-page)	Displays total number of lines and # of lines before and after the cursor.
Count number of matching regex in region	<f11> c m	(count-matches REGEXP &optional RSTART REND INTERACTIVE)	Print and return number of matches for REGEXP following point.
Count number of words in region	<f11> c W	(count-words-region START END &optional ARG)	Count the number of words in the region. If called interactively, print a message reporting the number of lines, words, and characters in the region (whether or not the region is active); with prefix ARG, report for the entire buffer rather than the region. ⚠ The M-= key is normally bound to this command. The PEL package binds it to the command <code>er/expand-region</code> instead (see ⌘ Marking table).
Count words in buffer	<f11> c w	(count-words START END)	Count words between START and END.
