

## The ls -l command output format

Output format example	-rw-r--r--@ 1jdoe staff 5111 9 Jun 14:30 readme.rst.txt										
Fields	-	rw-	r--	r--	@	1	jdoe	staff	5111	9 Jun 14:30	readme.rst.txt
	Device Type:	Owner	Group	Word	Optional Extra field		ownership				
Description	<div><div><div><div><div><div>-</div><div>Regular file.</div></div><div><div>b</div><div>Block special file.</div></div><div><div>c</div><div>Character special file.</div></div><div><div>C</div><div>High performance (contiguous data) file.</div></div><div><div>d</div><div>Directory.</div></div><div><div>D</div><div>Door (Solaris).</div></div><div><div>I</div><div>(letter I) Symbolic link.</div></div><div><div>M</div><div>Off-line (migrated) file (Cray DMF).</div></div><div><div>n</div><div>Network special file (HP-UX).</div></div><div><div>p</div><div>FIFO (named pipe).</div></div><div><div>P</div><div>Port (Solaris).</div></div><div><div>s</div><div>Socket.</div></div><div><div>?</div><div>Some other file type.</div></div></div></div><div>Note: use the <b>info ls</b> command to see more information related to your system.</div><div>See Also: <b>ls @ wikipedia</b> with all the identified external links.</div></div></div>	Discretionary Access Control (DAC)			Number of links or directories	User ownership: user that owns the file or directory	Group ownership	Size in bytes.  With <b>ls -lh</b> , size format is human readable with units: <ul style="list-style-type: none"><li><b>k</b> : kilo</li><li><b>M</b> : mega</li><li><b>G</b> : giga</li></ul>	Date of last modification.  Date format might be affected by the LANG environment variable.  On Linux, you can change the date format with the <b>-time-style</b> option.  For example: ls -l --time-style="long-iso"	Name of the file.	
		Permissions:		🍏 macOS only:							
Extra Notes:	• <a href="#">POSIX File System Permissions</a>										
		• <b>s</b> • <b>S</b>	The <b>s</b> and <b>S</b> bits identify whether the set user ID or set group ID permissions are active. These are special permissions bits that allow a program, when run by any user, to be run with the effective UID of the owner (identified by the ownership fields). <ul style="list-style-type: none"><li>For example, if the user ownership is root and the s bit is set, another user will be able to run the program as if it was root.</li></ul> This permission is therefore a security risk and should be restricted to the programs that absolutely require this (as sudo does for example).								
<div><div><div><div><div><div>🐧 <b>SELinux:</b></div><div>With <b>-Z</b> option:</div></div></div><div>References:</div></div></div><div><a href="#">SELinux security context</a><ul style="list-style-type: none"><li>Shown with the <b>-Z</b> option between ownership &amp; size for the <b>ls -l</b> output: in place of <b>_</b> above.</li><li><b>SELinux Notebook</b><ul style="list-style-type: none"><li><a href="#">Table of Contents</a></li></ul></li><li><b>Red Hat SELinux</b></li><li><b>SELinux @ Gentoo wiki</b></li><li><b>SELinux @ Fedora wiki</b></li><li><b>SELinux @ ArchLinux wiki</b></li><li><b>Rocky Linux 8 @ server-world</b></li><li><b>Alma Linux 9 @ server-world</b></li></ul></div></div>	• <b>?</b>	The <b>?</b> is displayed when the file has no associated <b>SELinux security context</b> .									
	SELinux contexts follow the SELinux <b>user:role:type:level</b> syntax with the following fields (as described in the <a href="#">SELinux RedHat web page</a> ):										
	• user (..._u)	The <b>SELinux user</b> identity. This can be associated to one or more roles that the SELinux user is allowed to use.									
	• role (..._r)	The <b>SELinux role</b> . This can be associated to one or more types the SELinux user is allowed to access.									
	• type (..._t)	The <b>SELinux type</b> of the file (the <b>SELinux object</b> ). It defines what access permissions the SELinux user has to that object.									
• level	<b>SELinux security level</b> field (or range). It is only present if the policy supports MCS or MLS. The entry can consist of: <ul style="list-style-type: none"><li>A single security level that contains a <b>sensitivity</b> level and zero or more <b>categories</b> (e.g. s0, s1:c0, s7:c10.c15).</li><li>A range that consists of two security levels (a low and high) separated by a hyphen (e.g. s0 - s15:c0.c1023).</li></ul>										
<div><div><div><div><div><div>👉 On SELinux:</div><div>The <b>-Z</b> switch is available on several utilities to show or manage SELinux security contexts information. For example:</div></div></div><div><div><div><div><div><div>ls -lZ</div><div>ps axZ</div><div>id -Z</div></div></div></div></div></div></div></div></div>
