

Lispy minor mode🚧🧑

Description	Key	Function	Note
<u>Lispy - Single letter commands to manipulate Lisp-like code</u>	<p>The lispy mode provides modal editing to Emacs for Lisp-like languages. Lispy is a very structured programming language, made of succession and combinations of S-expressions (“sexp”): lists that start with (and end with) “<i>paren</i>”. As long as point (the cursor) is before the left, opening, paren or the right, closing paren, the keys are interpreted as lispy commands. Keys in other locations are interpreted as usual. The nature of the Lips programming languages enables this type of modal editing that is even more powerful than Vi-type modal editing.</p> <p>This table lists the lispy command keys, with links to the Lispy function Reference for each one.</p> <p>📦This requires the lispy external package. 📦PEL downloads, installs and activates lispy when the pel-use-lispy user option is set to t.</p>		
Customize Lisp language support See also: 🔗 Customize	<ul style="list-style-type: none"><f11><f2>SPC M-L	(pel-cfg-pkg-lisp &optional OTHER-WINDOW)	Customize support for Lisp programming languages - A group that also contains the groups for Emacs Lisp and Common Lisp. <ul style="list-style-type: none">Opens the pel-pkg-for-lisp customize group that holds the pel-use-lispy user option.If OTHER-WINDOW is non-nil (use C-u), display in another window and open Elisp programming groups: lispy.
Customize PEL Lispy support See also: 🔗 Customize	<f11> <f2> G lispy RET	(customize-group &optional GROUP OTHER-WINDOW)	Opens the lispy customize group where you can customize lispy further. ⚠️ For this command to work the group must be known so you must first use a Lispy command or load lispy explicitly. With PEL you can use lispy-mode or lispy-describe-line.
Getting Help on code			
<u>Describe function at point</u> See Also: 🔗 Help/Info	<ul style="list-style-type: none">C-1<f12> 1	(lispy-describe-inline)	Display documentation for 'lispy--current-function' inline. <ul style="list-style-type: none">If docstring is small enough it is displayed in a pop-up box above point. Otherwise it is displayed inside a *lispy-help* buffer. 📦This requires the lispy external package. 📦PEL downloads, installs and activates lispy when the pel-use-lispy user option is set to t .
<u>Describe function arguments</u>	<ul style="list-style-type: none">C-2<f12> 2	(lispy-arglist-inline)	Show the argument list of current function.
<u>Describe function/variable</u>	xh		A shorthand for describe-function or describe-variable. If you want to call describe-variable, you should mark the symbol first.
Navigate inside code The following commands move point inside code when point is before left paren or after right paren.			
<u>ace symbol move</u>	a	(special-lispy-ace-symbol ARG)	Jump to a symbol within the current sexp and mark it. <ul style="list-style-type: none">Use ace method: each symbol in sexp is shown with highlight letter: type that letter to move to the symbol.Sexp is obtained by exiting the list ARG times.
<u>ace sub-word</u>	-		Similar to lispy-ace-symbol, but selects a subword instead.
<u>Move back</u>	b	(special-lispy-back ARG)	Move point to ARGth previous position in lisps-back history <ul style="list-style-type: none">If position isn’t special, move to previous or error.Lispy back history updated by: 1, h, f, j, k, m, q, and i.
<u>Move to different (other) side of sexp</u>	d	(special-lispy-different)	Switch to the different side of current sexp. <ul style="list-style-type: none">If before ‘ (’ move after ‘) ’ and vice-versa.
<u>Flow: move in the direction of current paren</u>	f	(special-lispy-flow ARG)	Move in the direction of current paren: <ul style="list-style-type: none">At left : move to next left paren (move going down the file).At right: move to previous right parent (move going up the file).Don’t enter strings or comments.Updates lispy-back history.
<u>Move left outward</u>	h	(special-lispy-left ARG)	Move outside list backwards ARG times. Return nil on failure, t otherwise.
<u>Move down current list</u>	j	(special-lispy-down ARG)	Move down ARG times inside current list. <ul style="list-style-type: none">Guaranteed to never exit the list: 99j moves to the last element of the current list.Updates lispy-back history.
<u>Move up current list</u>	k	(special-lispy-up ARG)	Move up ARG times inside current list. <ul style="list-style-type: none">Guaranteed to never exit the list: 99k moves to the first element of the current list.Updates lispy-back history.
<u>Start knight hydra</u>	z		Start/Terminate the knight hydra
<u>Move down left-most parens on each line</u>	<ul style="list-style-type: none">zjj		Move down left-most paren to the next line (can exit list)
<u>Move up left-most parens on each line</u>	<ul style="list-style-type: none">zkk		Move up left-most paren to the previous line (can exit list)
<u>Move outside list forward</u>	l	(special-lispy-right ARG)	Move outside list forwards ARG times. <ul style="list-style-type: none">Parens in strings and comments are ignored.Updates lispy-back history.
<u>Move to Ace target</u>	q		Highlights each symbol in current sexp as ace target and jump to the selected one. <ul style="list-style-type: none">Updates lispy-back history.
<u>Move to Ace target char</u>	Q		Prompts for character, highlights each one in current sexp as ace target and jump to the selected one.
<u>View: center current sexp</u>	v		Recenter current sexp to be on the first line of the window. When called twice in a row, recenter back to the original position.
<u>Visit another file</u>	V		Visit another file within this project using projectile or find-file-in-project (customize lispy-visit-method to choose). <ul style="list-style-type: none">Use V to call projectile-find-file. Use 2V to call projectile-find-file-other-window.
Search			
<u>Occur search inside the current top-level sexp</u>	y		Do an occur for the current top-level sexp. Go back-to-paren afterwards. This is useful e.g. to see where a particular variable is used within the current defun.
<u>goto definition using directory tabgs</u>	g	(special-lispy-goto &optional ARG)	Jump to symbol within files in current directory . Prompt for symbol and jump to it. <ul style="list-style-type: none">When ARG isn’t nil, call ‘lispy-goto-projectile’ instead.See lispy goto wiki page.
<u>goto definition using projectile base directory</u>	<ul style="list-style-type: none">0gogp	(lispy-goto-projectile)	Jump to symbol within files in (‘projectile-project-root’).
<u>goto definition in local file</u>	G		Similar to lispy-goto, but only current file's tags are used instead of whole directory's tags.
<u>Follow: jump to definition</u>	<ul style="list-style-type: none">FM-.		When region is active jump to the definition of marked symbol. Otherwise jump to the definition of the first symbol in current sexp.
<u>Pop tag</u>	<ul style="list-style-type: none">DM-,		Go back from where it came with Follow
<u>Narrow/Widening</u> See also: 🔗 Narrowing	<ul style="list-style-type: none">Narrowing hides everything in the buffer except the selected region, allowing work on that region alone.Widen it back to see the complete buffer again.		
<u>Narrow current sexp/region</u>	N		Narrow current sexp or region.

Description	Key	Function	Note
Cut/Paste/Mark/Hide/Indent			
Indent / hide/show outline	i	<ul style="list-style-type: none"> With no active region: (special-lispy-tab) 	If in outline: hide/show outline, otherwise indent all code of current paren <ul style="list-style-type: none"> When region is active, call 'lispy-mark-car'.
mark car	i	<ul style="list-style-type: none"> With active region: (lispy-mark-car) 	Mark the car of current thing. <ul style="list-style-type: none"> Updates lispy-back history.
Copy region or sexp to kill ring	n	(special-lispy-new-copy)	Copy marked region or sexp to kill ring.
Mark list	m	(special-lispy-mark-list ARG)	Mark the current sexp. If mark is already active, deactivate it instead. When ARG is more than 1, mark ARGth element. <ul style="list-style-type: none"> Updates lispy-back history.
Paste	P		When region is active, replace it with current kill. Forward to yank otherwise.
Edit code	Transform code using the following commands		
clone	c	(special-lispy-clone ARG)	Clone sexp ARG times. <ul style="list-style-type: none"> When the sexp is top level, insert an additional newline.
Move current sexp to the left	oh		
Move current sexp inside first element of list below	oj		
Move current sexp to become last element of list above	ok		
Move current sexp to the right, outside current list	ol		
Raise: use current sexp as replacement for its parent	r		
Raise: current and nextprevious sexp as replacement for their parent	R		Use current sexp and the following (if called from the left), or the preceeding (if called from the right) sexps, or the active region as replacement for their parent.
Move sexp down in list	s		Move current sexp or region down arg times. Don't exit the parent list. Also works for outlines.
undo	u		
Move current sexp up	w		Move current sexp or region up arg times. Don't exit the parent list. Also works for outlines.
Bind var: current sexp to let bound variable	xb		Transform the current list expression into a let-bound variable; iedit-mode is used to name the new variable. Use M-m to finish naming the variable.
Unbind a let bound variable	xu		Unbind a let-bound variable. Also works for Clojure.
turn current lambda into a defun	xd		
turn current defun into a lambda	xl		
turn nested if into cond	xc		
turn cond into nested if expressions	xi		
Inline current function or macro call	xf		Inline current function or macro call, i.e. replace it with function body. The function should be interned and its body find-able.
Convolute: Exchange the order of application of 2 closest outer forms	C		Exchange the order of application of two closest outer forms, relative to current expression or region.
Slurp: grow either current sexp or region	>		Grow either current sexp or region (if it's active) in appropriate direction. Opposite of lispy-barf. <ul style="list-style-type: none"> With an arg of 0, grow as far as possible. With an arg of -1, grow until the end of the line where the current sexp ends or as far as possible before that position.
Barf: shrink either current sexp or region	<		Shrink either current sexp or region (if it's active) in appropriate direction. Opposite of lispy-slurp.
Splice the current list into the parent list	/		Splice the current list into the parent list. Move the point to the next list to splice in appropriate direction. If there are none within the parent list, move to the parent list in appropriate direction.
Move to beginning of current defun	A		Forward to beginning-of-defun. When called twice in a row, restore the previous point and mark positions.
Teleport: move current sexp to Ace target	t		Move current sexp to Ace target inside current function
	tt		Move current sexp to Ace target to any sexp inside current window
Move to Ace target symbol & erase to replace	H		Calls lispy-ace-symbol and deletes the selected symbol.
Convert current sexp into multi-line	M		Extend current sexp into multiple lines. Especially useful on results of macroexpand.
Turn current sexp into one line	O		Turn current sexp into one line.
Stringify current sexp	S		Transform current sexp into a string. Quote newlines if arg isn't 1.
Insert a space	Space		
Outline operations			
Toggles on off org-mode-like outline	I		Toggles on/off an org-mode-like outline. <ul style="list-style-type: none"> To make this work, lispy-mode will modify outline-regexp and outline-level-function for the current buffer while it's on.
Indent / hide/show outline	i	<ul style="list-style-type: none"> With no active region: (special-lispy-tab) 	If in outline: hide/show outline, otherwise indent all code of current paren <ul style="list-style-type: none"> When region is active, call 'lispy-mark-car'.
Next outline level	J		Takes a numeric prefix arg and calls outline-next-visible-heading arg times or until past the last outline-regexp.
Previous outline level	K		Takes a numeric prefix arg and calls outline-previous-visible-heading arg times or until past the first outline-regexp.
Evaluate Code			
Eval last sexp	e	(special-lispy-eval ARG)	Eval last sexp. Display result in echo area. <ul style="list-style-type: none"> When ARG is 2, insert the result as a comment.
Eval current region sexp. Insert result.	E		Eval current region or sexp. The result will be inserted in the current buffer after the evaluated expression.
Eval current sext & replace it at point	xr		

Description	Key	Function	Note
Eval current sexp in the content of the of the other window	p		
EDebug current defun	xe		edebug current defun. Or cider-debug-defun-at-point for Clojure.
	2xe		2xe will eval current defun instead.
Debug - step in	xj		<ul style="list-style-type: none"> Evaluate the arguments at the current function's call Jump to the function's definition Set the result of evaluation to the function's arguments
EDebug stop	z		Does the same as q in edebug, except current function's arguments will be saved to their current values. <ul style="list-style-type: none"> This allows to continue debugging with lispy-eval (e) from edebug's current context. The advantage is that you can edit the code as you debug, as edebug puts your code in read-only mode.
Execute Tests: run ert	xT		
Buffer/Region operations			
Store current buffer and region for further operation	xB		
Ediff regions	B
