

Emacs support for the Seed7 Programming Language

Description	Keystroke		Function	Note
Seed7 Editing <ul style="list-style-type: none">Help & customizationCommentsTemplate ExpansionSeed7 abbreviationsAuto-indentMarkingNavigationCompilationSeed7 Information	PEL supports for the Seed7 programming language is experimental and not yet documented except for what you see here. <ul style="list-style-type: none"> The seed7-mode external package is installed when  the pel-use-seed7 user-option is set to t.Seed7 files are files with .sd7 and .s7i extensions. The seed7-mode supports: <ul style="list-style-type: none">Seed7 code highlightingInsertion of Seed7 block or line-end comments. Ability to select which type is inserted by comment-swim.<ul style="list-style-type: none">PEL also provides a command to select the comment style allowing easy selection of different styles of multi-line comments, a feature provided by Emacs that PEL uses and provides an easy selection at prompt.Seed7 code navigation across function and procedures as well to start/end of blocks inside functions/procedure as well as enum and struct.imenu support, allowing use of all imenu-based navigation commands and pop-up menus. Identifies callable (functions and procedures), interfaces, enums, structs. Speedbar support and top menu with available commands. (see  Menus)Seed7-syntax-aware auto-indentation and auto-fill-mode are supported.Code keyword expansion to Seed7 statements with ability to jump to next field to fill with tempo markers and navigation to those.outline-minor-mode to list the name of Seed7 callables. See  Outline for more information.Invocation of Seed7 compiler tools to perform static analysis or compilation of Seed7 code.			
Last updated on:	2025-06-14			
Open this PDF file. See also:  Help/Info	<f11> SPC 7 <f1>	(pel-help-pdf &optional OPEN-WEB-PAGE)	Open the  - Seed7 local PDF. If the prefix argument (like C-u or M--) is used, then it opens the remote GitHub hosted raw PDF instead. If the pel-flip-help-pdf-arg user-option is set it's the other way around.	
	<f12> <f1>			
 Customize PEL Seed7 support	<f11> SPC 7 <f2>	(pel-customize-pel &optional OTHER-WINDOW)	Customize PEL Seed7 support. <ul style="list-style-type: none">If OTHER-WINDOW is non-nil (use C-u), display in another window.	
	<f12> <f2>			
 Customize Emacs Seed7 support	<f11> SPC 7 <f3>	(pel-customize-library &optional OTHER-WINDOW)	Customize Emacs Seed7 support: seed7 <ul style="list-style-type: none">If OTHER-WINDOW is non-nil (use C-u), display in another window.	
	<f12> <f3>			
Show seed7-mode version information	C-c v	(seed7-mode-version)	Print `seed7-mode' version UTC time stamp.	
Comments	Several commands are unavailable to insert and manipulate commands, listed in  Comments . Some are duplicated here for convenience. The ones specific to seed7-mode are listed first.			
Toggle between Seed7 (* block *) and # line style	C-c ;	(seed7-toggle-comment-style &optional ARG)	Toggle the Seed7 comment style between block and line comments. <ul style="list-style-type: none">Optional numeric ARG, if supplied, switches to block comment style when positive, to line comment style when negative, and just toggles it when zero or left out. Note: the default style for all Seed7 buffers is controlled by the `seed7-uses-block-comment' customizable user-option. The default is line style comments.	
Insert, realign, comment/uncomment region See also:  Comments With PEL: Comment the current line with M-0 M-;	M-;	(comment-dwim ARG)	Insert or realign comment on current line (or region if a region is active). <ul style="list-style-type: none">On a single line, the comment is placed <i>after</i> the code. If line/region is already commented, uncomment it. <ul style="list-style-type: none">C-u M-; executes comment-kill	
		(pel-comment-dwim ARG)	Same as comment-dwim but comments the current line with a numeric ARG or 0.	
Toggle display of comments in buffer or active region See also:  Comments	<f11> ; ;	(hide/show-comments-toggle &optional START END)	Toggle hiding/showing of comments in the active region or whole buffer. <ul style="list-style-type: none">If the region is active then toggle in the region. Otherwise, in the whole buffer.  This requires the hide-comnt.el package (see  Comments).  PEL activates it when the pel-use-hide-comnt user option is t.	
Change comment style for buffer	<f11> ; s	(pel-comment-style &optional CUSTOMIZE)	Select a comment style for the buffer: prompts with the list of available styles, showing the currently used one. Apply the choice to the current buffer. <ul style="list-style-type: none">With C-u prefix, open the customize buffer to control selection of the default comment style for all buffers (the comment-style user option).	
	Emacs supports several comment styles, as specified by the comment-styles user-option (which can be modified). Some of these styles only take effect when a region of several lines is comments. By changing the style you can create the boxed comments, for instance and also uncomment the box comment with comment-swim (bound to M-;) and then change for another comment style in the same buffer. <ul style="list-style-type: none">The style selected by the command only affects the current buffer. It is not persistent. The persistent setting is the comment-style user option.<ul style="list-style-type: none">0 = plain: Start in column 0 (do not indent), as in Emacs-201 = indent-or-triple: Start in column 0, but only for single-char starters2 = indent: Full comment per line, ends not aligned3 = aligned: Full comment per line, ends aligned4 = box: Full comment per line, ends aligned, + top and bottom5 = extra-line: One comment for all lines, end on a line by itself6 = multi-line: One comment for all lines, end on last commented line7 = box-multi: One comment for all lines, + top and bottom As of Emacs 30, Emacs supports 8 different comment styles, listed here: ➡➡			
Code Template expansion	The seed7-mode supports a set of code keyword expansion to Seed7 statements with ability to jump to next field to fill with tempo markers and navigation to these fields to complete the template easily. <ul style="list-style-type: none">Code keyword expansion is performed by the seed7-complete-statement-or-indent command, bout to the <tab> key.Type the keyword then type <tab> to expand the keyword into the corresponding code that will be properly indented. There are 2 groups of supported keywords. <ul style="list-style-type: none">The keywords shown in the first part of the table expand to their corresponding code template when the keyword is the only word on the line and point is placed just after the last keyword character.			
Top level or block declarations. Type the keyword at the beginning of the line and hit <tab> to expand the corresponding code.	inc	include statement	for	for statement
	const	constant declaration	foru	for-until statement
	var	variable declaration	fors	for-step statement
	proc	procedure declaration	fore	for-each statement
	func	function declaration	foreu	for-each statement combined with an until condition
	funcs	short function declaration	forek	for-each-key statement
	enum	enum type declaration	foreku	for-each-key statement combined with an until condition
	struct	struct type declaration	fork	for-key statement
	case	case statement	forku	for-key statement combined with an until condition
	if	if statement	repeat	repeat - until statement
	ife	if statement with an else clause	while	while statement
	ifei	if statement with an elsif clause		
	ifeie	if statement with an elsif and an else clause		
Parameter declarations Also expand with <tab>	The second group of keywords are expanded when the keyword precedes a closing parenthesis; they are use to expand the parameter declarations.			
	in	Declaration of an in-parameter .	callbn	Declaration of a call-by-name parameter .
	inout	Declaration of an inout-parameter .	ref	Declaration of a reference-parameter .
	invar	Declaration of an in-var-parameter .	val	Declaration of a value-parameter .
Expand keyword or indent	<tab>	(seed7-complete-statement-or-indent)	If point follows a valid code keyword properly located, this perform code expansion, leaving point at the first location that must be filled. <ul style="list-style-type: none">In that case you can then type <backtab> to move to the next field that needs to be filled (or has already been filled). Those are tempo markers that stay in the buffer until the buffer is closed. If point is located anywhere else indent the line or selected block.	
Move to next field	<backtab>	(tempo-forward-mark)	Move point to the next tempo marker , the next template field to fill.	

Description	Keystroke	Function	Note

<div>Seed7-specific abbreviations</div> <div>See also: 🔗 Abbreviations</div>	<div>The seed7-mode supports Seed7-specific abbreviations for Emacs abbrev-mode when the seed7-support-abbrev-mode customizable user-option is on (the default).</div> <div><ul style="list-style-type: none">All abbreviation and their text expansion are set by the seed7-abbreviations customizable user-option list.<ul style="list-style-type: none">The default list is shown below. All abbreviations start with a semi-colon.You can modify the default and add other abbreviations through customization.These abbreviations are <i>system</i> abbreviations, treated specially by the abbrev-mode in the sense that youcanngt modify them dynamically via the abbrev-mode commands. But you don't need to since they can be modified by customization.Of course you can create other abbreviations that help you write code or comments. See 🔗 Abbreviations for more details related to abbreviations in Emacs.To expand the abbreviations, the abbrev-mode must be active: type the abbreviation followed by a word-separating character, such as <space>, <RET>, semi-colon, period, comma, etc..</div> <div>👉 Use the list-abbrevs command to list all abbreviations (<f11> a M-1 with PEL), including the following Seed7-specific ones. The list are shown in sorted order.</div>					
Pragmas & in-statement keywords	pragmas		in-statement keywords		in-middle statement keywords	
	;de	decls	;fo	forward	;dt	downto

	;cre	CREATE_ERROR	;ie	INDEX_ERROR	;re	RANGE_ERROR
	;dbe	DATABASE_ERROR	;ine	IN_ERROR		

Syntax-aware automatic Indentation	Unless explicitly disabled by setting the seed7-auto-indent user-option to nil, the <tab> and <return> key perform syntax-aware automatic indentation of Seed7 code. The <return> key also supports the auto-fill-mode. <ul style="list-style-type: none"> The number of columns used for each indentation level is controlled by the seed7-indent-width user-option, which defaults to 2. Emacs can use hard tabs as appropriate when you activate the indent-tabs-mode. If it is off Emacs only uses space characters. See the 🔗 Indentation page for more information related to indentation control and commands.		
Auto-fill-mode	The seed7-mode supports Emacs auto-fill-mode, useful when typing comments. See the 🔗 Fill/Justify page and the pel-comment-style command above.		
Marking	The seed7-mode support specialized marking. It is also compatible with other Emancs native and package commands. See 🔗 Marking for more information.		
Mark current callable	C-M-h	(seed7-mark-defun)	Mark the current Seed7 function or procedure. <ul style="list-style-type: none"> Put the mark at the end and point at the beginning. If point is before or between 2 functions or procedure, mark the next one.

Description	Keystroke	Function	Note
Code Navigation	The seed7-mode supports syntax-aware procedure/function as well as block aware navigation commands <ul style="list-style-type: none">• PEL provides some extra key bindings to Emacs native navigation commands.• The seed7-mode also supports imenu-compliant parsing which enables the ability to use a large set of navigation packages.<ul style="list-style-type: none">• See navigation by symbol definition in the Navigation page for more information.• The seed7-mode navigation commands display the name and type of block found when the seed7-verbose-navigation user-option is turned on (set to t).		
Shift-Selection	If you press and hold the shift key while typing a movement command, that sets the mark before moving point (Emacs name for cursor) so that the region extends from the original point to its new position. This is called: Shift-Selection . <ul style="list-style-type: none">• Shift selection is supported by some navigation commands, not all. The following symbols are used to identify whether the command supports shifts selection:<ul style="list-style-type: none">•  This command supports shift selection in GUI and terminal mode.•  This command supports shift selection only in GUI mode.•  This command supports shift selection in GUI mode and also in terminal mode under some conditions (described in the description cell for the command).•  This command does not support shift selection. Sometimes for this you can first set the mark before moving.• Pressing the Shift key when using the key binding for commands that do not show any of these 3 arrows have no impact on the shift selection (and may be inappropriate for the command).		
Move Point	The following sub-sections describe how to navigate across various types of textual and syntactical entities.		
• by defun	The commands move point by Seed7 function and procedure definitions.  In PEL: <ul style="list-style-type: none">• The <f12> cursor key mappings use <up> and <down> to move to the beginning or end of the function, procedure or other blocks.• The <f6> cursor key mapping use <up> and <down> to move to the beginning or end of the function or procedure.• The <f6> cursor key mapping use <right> and <left> to move to the beginning or end of the next/previous function or procedure.• The advantage of the <f6> and <f12> key bindings is they support Shift-Selection for Emacs in terminal mode, as opposed to the key bindings that sue the Control key which can only support Shift-Selection when Emacs is running in Graphics mode.		
Backward to beginning of defun  	<ul style="list-style-type: none">• <f6> <up> <ul style="list-style-type: none">• C-M-a• C-M-<home>• C-[C-a• Esc C-a	(seed7-beg-of-defun &optional N SILENT DONT-PUSH-MARK)	Move backward to the beginning of a defun. <ul style="list-style-type: none">• With ARG, do it that many times. Negative ARG means move forward to the ARGth following beginning of defun.• Prints the name of the function or procedure in the message area.• On successful move, you can move back to original position by typing M-`, <f6> <f6> or <f11> . `• Supports Shift-Selection in graphics mode. <f6><up> supports it in terminal mode too.
Forward to end of defun  	<ul style="list-style-type: none">• <f6> <down> <ul style="list-style-type: none">• C-M-e• C-M-<end>• C-[C-e• Esc C-e	(seed7-end-of-defun &optional N SILENT DONT-PUSH-MARK)	Move forward to next end of defun. <ul style="list-style-type: none">• With argument, do it that many times. Negative argument -N means move back to Nth preceding end of defun.• Prints the name of the function or procedure in the message area.• On successful move, you can move back to original position by typing M-`, <f6> <f6> or <f11> . `• Supports Shift-Selection in graphics mode. <f6><down> supports it in terminal mode too.
Forward to start of next defun 	<f6> <right>	(seed7-beg-of-next-defun &optional N SILENT DONT-PUSH-MARK)	Move forward to the beginning of the next function or procedure. <ul style="list-style-type: none">• With optional argument N, repeat the search that many times.• Move back to previous position with M-`, <f6> <f6> or <f11> . `• Supports Shift-Selection.
Backward to end of previous define   will be replaced	<f6> <left>	(pel-end-of-previous-defun &optional SILENT DONT-PUSH_MARK)	Move backwards to the end of the previous function definition. <ul style="list-style-type: none">• Issue user error not find end of previous function unless SILENT is non-nil.• If the end of previous function is found, push the start location to the mark ring unless DONT-PUSH_MARK is non-nil.<ul style="list-style-type: none">• Move back to previous position with M-`, <f6> <f6> or <f11> . `• Supports Shift-Selection.
Forward to end of current block statement 	<f12> <down>	(seed7-to-block-forward)	Move forward from the beginning of a Seed7 block to its end. <ul style="list-style-type: none">• Supports the Seed7 <code>if/end if</code>, <code>block/end block</code>, <code>case/end case</code>, <code>enum/end enum</code>, <code>for/end for</code>, <code>repeat/until</code>, <code>struct/end struct</code>, <code>while/end while</code>. It also supports moving to the end of a function or a procedure.<ul style="list-style-type: none">• Move back to previous position with M-`, <f6> <f6> or <f11> . `• Supports Shift-Selection.
Backward to beginning of current block statement 	<f12> <up>	(seed7-to-block-backward)	Move backward from the end of a Seed7 block to its beginning. <ul style="list-style-type: none">• supports the Seed7: <code>if/end if</code>, <code>block/end block</code>, <code>case/end case</code>, <code>enum/end enum</code>, <code>for/end for</code>, <code>repeat/until</code>, <code>struct/end struct</code>, <code>while/end while</code>. It also supports moving to the end of a function or a procedure.<ul style="list-style-type: none">• Move back to previous position with M-`, <f6> <f6> or <f11> . `• Supports Shift-Selection.
Move to top of block 	C-c C-t	(seed7-to-top-of-block)	Move point to the top of the current block; out of any nesting.
Compilation	The Seed7 source code is either interpreted or compiled. In both cases you can verify it's validity by performing a static check of the code, an operation that does not generate any binary file but perform the same language checking that the compiler will do.		
Static check or compile Seed7 file See Navigation Compilation Mode C-c C-c static check C-u C- C-c compile	C-c C-c <f12> c	(seed7-compile &optional COMPILE)	Static check current Seed7 file, show errors in compilation-mode buffer. <ul style="list-style-type: none">• With optional COMPILE argument: compile the file to executable instead.<ul style="list-style-type: none">• Any argument>. Use C-u C-c C-c or M-0 M-<F12> c <ul style="list-style-type: none">• For example: type C-u <f12> c for compiling the file. Without the C-u prefix it just static checks the file, an operation that is much faster.• The static analysis is performed by the command identified by the seed7-checker user-option, which defaults to s7-check.<ul style="list-style-type: none">• You can specify any command with or without its path.• The compilation is performed by the command identified by the seed7-compiler user-option, which defaults to s7c.<ul style="list-style-type: none">• You can specify any command with or without its path.• Any detected error is shown in a "compilation" Navigation Compilation Mode buffer. Use it to navigate to the line of the code in error.
