

Emacs support for the Erlang Programming Language

Description	Keystroke	Function	Note
Erlang Support See also: <ul style="list-style-type: none"> • Erlang Reference • Concise Guide To Erlang • about-erlang • Developing Erlang Code with PEL <ul style="list-style-type: none"> • set PEL Erlang environment • ⌘ Hide/Show • ⌘ Text Modes • ⌘ Highlight • ⌘ Inserting Text • ⌘ Customize <div>  Identify minor modes to activate automatically in erlang-mode buffers </div> <ul style="list-style-type: none"> • ⌘ Speedbar 	Emacs supports Erlang via the following external packages:  The erlang.el external package (see erlang.el source), part of OTP  PEL activates it with pel-use-erlang .  The EDTS external package  PEL activates it with pel-use-edts (set to t or start-automatically).  The lsp-mode external package  PEL activates it with pel-use-erlang-ls . Uses the erlang_ls Erlang LSP server. Integrates with: <ul style="list-style-type: none"> •  Helm by using helm-lsp  PEL activates with pel-use-helm-lsp.  Ivy by using lsp-ivy  PEL activates with pel-use-lsp-ivy. •  treemacs by using lsp-treemacs  PEL activates with pel-use-treemacs and pel-use-lsp-treemacs. •  origami by using lsp-origami  PEL activates with pel-use-lsp-origami. The Distel external package also exists, but seems to have mainly been replaced by EDTS and needs maintenance. PEL does not support it.  The hide-comnt.el external package.  PEL activates it with pel-use-hide-comnt  The iedit external package.  PEL activates it with pel-use-iedit .  The smart-dash external package.  PEL activates it with pel-use-smart-dash . erlang-mode is in pel-modes-activating-smart-dash-mode .  The smartparens external package.  PEL activates it with pel-use-smartparens . Add it to pel-erlang-activates-minor-modes .	<div>  Useful global minor-modes to activate features in Erlang via pel-activates-global-minor-mode: show-paren-mode </div> <div>  Customization: <ul style="list-style-type: none"> • Type <f11> <f2> g followed by the group name and RET to open the specific customization group or one of the following key sequences. <ul style="list-style-type: none"> • pel-pkg-for-erlang: to activate pel-use-erlang: use <f11> SPC e <f2> , or <f12> <f2> from an Erlang buffer. This has sub-group: see pel-erlang-ide group to activate EDTS and LSP. <ul style="list-style-type: none"> • erlang: when pel-use-erlang is on, use <f11> SPC e <f3> 1 • edts: when pel-use-edts is on, use <f11> SPC e <f3> 3 • lsp-erlang: when pel-use-erlang-ls is on, use <f11> SPC e L <f3> 1 • lsp-mode: when pel-use-erlang-ls is on, use <f11> SPC e L <f3> 2 The pel-pkg-for-erlang group has several user-options to control Erlang editing. Only some of them are described here. Use Emacs for the complete list. <ul style="list-style-type: none"> • pel-erlang-shell-prevent-echo: set to t to prevent the Erlang shell from echoing every command. • pel-erlang-activates-minor-modes: Schedules activation of local minor modes in erlang-mode buffers, eg. smart-dash-mode. • pel-erlang-environment group: <ul style="list-style-type: none"> • pel-erlang-man-parent-rootdir: Identifies the parent directory of Erlang man directory. The man directory should hold the man1, man3, man4 and man6 which contain Erlang man files. If this is set PEL sets (override) the erlang.el erlang-root-dir user-option value with it which activates the appropriate Erlang man files. Without PEL or if pel-erlang-man-parent-rootdir is nil, you must set the erlang-root-dir user-option yourself. • pel-erlang-exec-path: Identifies the directory where Erlang binaries are stored. • pel-erlang-version-detection-method: identifies a mechanism to detect Erlang/OTP version. By default it uses an Erlang script provided with PEL. • pel-erlang-code-style group: <ul style="list-style-type: none"> • pel-erlang-fill-column : column where line-wrapping occurs : maximum line length (defaults to 100). You can change the value or set it nil. • When pel-erlang-fill-column user option is nil, erlang-mode buffers use the Emacs fill-column value like other major modes. • pel-erlang-skel-use-separators: whether line separators are used in Erlang code templates (see the <i>Insert Erlang Code Template</i> section below), • pel-erlang-skel-use-secondary-separators : whether secondary separator lines are inserted by some Erlang code templates, • pel-erlang-skel-insert-file-timestamp: whether automatically updated time stamps are inserted in Erlang source code file header blocks. • PEL adds ⌘ Speedbar for .erl, .hrl and .escript Erlang files to show the list of functions. </div>	Open the ⌘ - Erlang local PDF. If the prefix argument (like C-u or M--) is used, then it opens the remote GitHub hosted raw PDF instead. If the pel-flip-help-pdf-arg user-option is set it's the other way around.  Key sequences that start with <f11> SPC e are available from any major modes. Key sequences that start with <f12> are only available in erlang-mode buffers. The <f12> keys sequences are mirrored by the <M-f12> key sequence for convenience.
Open this PDF file. See also: ⌘ Help/Info	<div> <f11> SPC e <f1> <f11> SPC e w <f1> <f11> SPC e L <f1> </div> <div> <f12> <f1> <f12> w <f1> <f12> L <f1> </div>	(pel-help-pdf &optional OPEN-WEB-PAGE)	
⌘ Customize PEL Erlang support	<div> <f11> SPC e <f2> </div> <div> <f12> <f2> </div>	(pel-customize-pel &optional OTHER-WINDOW)	Customize PEL Erlang support: access PEL user-options to activate Erlang support packages. <ul style="list-style-type: none"> • If OTHER-WINDOW is non-nil (use C-u), display in another window.
⌘ Customize Emacs Erlang support	<div> <f11> SPC e <f3> </div> <div> <f12> <f3> </div>	(pel-customize-library &optional OTHER-WINDOW)	Customize Emacs Erlang support: erlang, erldoc, edts, auto-highlight-symbol, lsp-mode, lsp-ui, lsp-treemacs. <ul style="list-style-type: none"> • If OTHER-WINDOW is non-nil (use C-u), display in another window.
⌘ Customize PEL LSP for Erlang support	<div> <f11> SPC e L <f2> </div> <div> <f12> L <f2> </div>	(pel-customize-pel &optional OTHER-WINDOW)	Customize PEL LSP Erlang support <ul style="list-style-type: none"> • If OTHER-WINDOW is non-nil (use C-u), display in another window.  This is available when pel-use-erlang-ls is turned on.
⌘ Customize Emacs LSP for Erlang support	<div> <f11> SPC e L <f3> </div> <div> <f12> L <f3> </div>	(pel-customize-library &optional OTHER-WINDOW)	Customize Emacs LSP Erlang support: lsp-erlang, lsp-mode, lsp-ui, helm-lsp, lsp-ivy, lsp-origami, lsp-treemacs. <ul style="list-style-type: none"> • If OTHER-WINDOW is non-nil (use C-u), display in another window.  This is available when pel-use-erlang-ls is turned on.
⌘ Customize PEL LSP Window for Erlang support	<div> <f11> SPC e w <f2> </div> <div> <f12> w <f2> </div>	(pel-customize-pel &optional OTHER-WINDOW)	Customize PEL LSP Erlang support <ul style="list-style-type: none"> • If OTHER-WINDOW is non-nil (use C-u), display in another window.  This is available when pel-use-treemacs and/or pel-use-lsp-treemacs is turned on.
⌘ Customize Emacs LSP Window for Erlang support	<div> <f11> SPC e w <f3> </div> <div> <f12> w <f3> </div>	(pel-customize-library &optional OTHER-WINDOW)	Customize Emacs LSP Erlang support: lsp-treemacs, treemacs <ul style="list-style-type: none"> • If OTHER-WINDOW is non-nil (use C-u), display in another window.  This is available when pel-use-treemacs and/or pel-use-lsp-treemacs is turned on.
Environment Help	Use the following command to verify your Erlang environment.		
Erlang Mode version	<div> <f11> SPC e ? </div> <div> <f12> ? </div>	(pel-show-erlang-version)	Display the following information in the minibuffer. Displays current version of available Erlang system, of erlang.el , of erlang_ls (if available), values of erlang-root-dir and pel-erlang-man-parent-rootdir.  Check that erlang-root-dir matches the version of Erlang you use. If not check the setting of the erlang-man-parent-rootdir . For more information see set PEL Erlang environment .
Syntax Highlighting	The erlang.el external package provides several levels of Erlang code syntax highlighting: <ul style="list-style-type: none"> • Off, Level 1: comments only, Level 2, Level 3, Level 4: maximum variety. There is not key binding for this. You must use the Syntax Highlighting section of the Erlang menu: <ul style="list-style-type: none"> • In terminal mode Type <f10> to access the menu, then select Erlang, Syntax Highlighting and the level you want. 		
Electric Keys	The following keys have “ <i>electric</i> ” behaviour and perform special editing tasks to help edit Erlang source code. Some of the electric behaviour is provided by the erlang-mode package, other by the smartparens. The latter take effect only when the smartparens-mode is active. Use <f11> ((to toggle smartparens-mode on and off.		
Return and indent  (does not seem to indent)	RET	(erlang-electric-newline &optional ARG)	Break line at point and indent, continuing comment if within one. <ul style="list-style-type: none"> • The variable ‘erlang-electric-newline-criteria’ states a criterion, when fulfilled a newline is inserted and the next line is indented. • Should the current line begin with a comment, and the variable ‘comment-multi-line’ be non-nil, a new comment start is inserted. • Should the previous command be another electric command we assume that the user pressed newline out of old habit, hence we will do nothing.

Description	Keystroke	Function	Note
Delete forward, jump over block pair until block is empty then delete block <ul style="list-style-type: none">⌘ X Smartparens with smartparens-mode active	<ul style="list-style-type: none"><code><deletechar></code>	(sp-delete-char &optional ARG)	Delete a character forward or move forward over a delimiter. <ul style="list-style-type: none">If on an opening delimiter, move forward into balanced expression.If on a closing delimiter, refuse to delete unless the balanced expression is empty, in which case delete the entire expression.If the delimiter does not form a balanced expression, it will be deleted normally.With a numeric prefix argument N > 0, delete N characters forward.With a numeric prefix argument N < 0, delete N characters backward.With a numeric prefix argument N = 0, simply delete a character forward, without regard for delimiter balancing.If ARG is raw prefix argument C-u, delete characters forward until a closing delimiter whose deletion would break the proper pairing is hit.
Standard delete forward character	<ul style="list-style-type: none"><code><deletechar></code>	(delete-forward-char N &optional KILLFLAG)	Delete the following N characters (previous if N is negative). <ul style="list-style-type: none">If Transient Mark mode is enabled, the mark is active, and N is 1, delete the text in the region and deactivate the mark instead.To disable this, set variable ‘delete-active-region’ to nil.Optional second arg KILLFLAG non-nil means to kill (save in kill ring) instead of delete. Interactively, N is the prefix arg, and KILLFLAG is set if N was explicitly specified.When killing, the killed text is filtered by ‘filter-buffer-substring’ before it is saved in the kill ring, so the actual saved text might be different from what was killed.
Delete backward, jump over block pair until block is empty then delete block <ul style="list-style-type: none">⌘ X Smartparens with smartparens-mode active	<ul style="list-style-type: none">DEL	(sp-backward-delete-char &optional ARG)	Delete a character backward or move backward over a delimiter. <ul style="list-style-type: none">If on a closing delimiter, move backward into balanced expression.If on a opening delimiter, refuse to delete unless the balanced expression is empty, in which case delete the entire expression.If the delimiter does not form a balanced expression, it will be deleted normally.With a numeric prefix argument N > 0, delete N characters backward.With a numeric prefix argument N < 0, delete N characters forward.With a numeric prefix argument N = 0, simply delete a character backward, without regard for delimiter balancing.If ARG is raw prefix argument C-u, delete characters backward until a opening delimiter whose deletion would break the proper pairing is hit.
Standard delete backward character	<ul style="list-style-type: none">DEL	(backward-delete-char-untabify ARG &optional KILLP)	Delete characters backward, changing tabs into spaces. <ul style="list-style-type: none">The exact behavior depends on ‘backward-delete-char-untabify-method’.Delete ARG chars, and kill (save in kill ring) if KILLP is non-nil.Interactively, ARG is the prefix arg (default 1) and KILLP is t if a prefix arg was specified.
Electric <	<	(erlang-electric-lt &optional ARG)	Insert a less-than sign, and optionally mark it as an open paren.
Electric > (for the end of arrow)	>	(erlang-electric-gt &optional ARG)	Insert a greater-than sign, and optionally insert a new line and indent.
Electric comma 	,	(erlang-electric-comma &optional ARG)	Insert a comma character and possibly a new indented line.
	<ul style="list-style-type: none">The variable ‘erlang-electric-comma-criteria’ states a criterion, when fulfilled a newline is inserted and the next line is indented. The functions in this list are called, in order, whenever a comma is typed. Each function in the list is called with no arguments, and should return one of the following values:<ul style="list-style-type: none">nil -- no determination made, continue checking‘stop’ -- do not create prototype for next line(anything else) -- insert prototype, and stop checkingIf every function in the list is called with no determination made, then no prototype is inserted.Behaves just like the normal comma when supplied with a numerical arg, point is inside string or comment, or when there are non-whitespace characters following the point on the current line.		
Electric semicolon	;	(erlang-electric-semicolon &optional ARG)	Insert a semicolon character and possibly a prototype for the next line.
	<ul style="list-style-type: none">The variable ‘erlang-electric-semicolon-criteria’ states a criterion, when fulfilled a newline is inserted, the next line is indented and a prototype for the next line is inserted. Normally the prototype consists of " ->". Should the semicolon end the clause a new clause header is generated.The variable ‘erlang-electric-semicolon-insert-blank-lines’ controls the number of blank lines inserted between the current line and new function header.Behaves just like the normal semicolon when supplied with a numerical arg, point is inside string or comment, or when there are non-whitespace characters following the point on the current line.		
Matching pairs <ul style="list-style-type: none">⌘ X Smartparens	<div>(</div> <div>[</div> <div>{</div> <div>"</div> <div>'</div> <div><<</div>	<div>When the smartparens external package is used and the smartparens-mode is active, the characters on the left are taken to be part of a pair. The pairs are: (), [], {}, “ “, ‘ ‘, and << >>.</div> <div><ul style="list-style-type: none">To enclose a piece of text inside one of those pairs, mark the text area then type the first character of the pair.The smartparens-mode can be activated automatically for Erlang by adding erlang-mode to the pel-erlang-activates-minor-modes user-option.Use the <f11> (_ key sequence to toggle the smartparens-mode on and off.There’s also the smartparens-strict-mode but that does not help much in Erlang.</div>	
Erlang Comments Comments @ Erlang Programming Rules & Conventions See also: ⌘ Comments	Erlang uses the % character to identify line comments. It uses the following conventions: <ul style="list-style-type: none">% - Single percent characters for comments located toward the end of a line of code%% - Two percent characters are used for comments starting at indentation level.%%% - Three percent characters are used to describe modules and are always placed in the first column The location of the comment on a code line is controlled by the comment-column variable. Set it with comment-set-column , bound to C-x ;		
Comment/un-comment <ul style="list-style-type: none">PEL extension of comment-dwim specialized for Erlang. Automatically uses the %%% comment when appropriate.★★Note:<ul style="list-style-type: none">M-; works much better than C-c C-c and C-c C-uPEL maps M-; to pel-erlang-comment-dwim which works even better. See also: ⌘ Comments	<div>M-;</div> <div>(comment-dwim ARG)</div> <div>(pel-erlang-comment-dwim &optional ARG)</div>	<div>Comment line or region with % or %% style comments depending on the location in the buffer.</div> <div>Does the same but adds ability to insert %%% comments. It does that on the very first line in the buffer and lines that follow a line that starts with %%%.</div>	<div><ul style="list-style-type: none">When no marked region and no comment: On empty line: insert %% comment starter at the proper indentation level. On first empty line in buffer: insert %%% comment. Also following lines or region that starts with %%% On line with code: insert % comment starter after the code for an end-of-line commentWith marked un-commented region: Comment region (each line is commented)With marked commented region: Un-comments the region.To force insert %%% comment style: type M-3 M-;. The M-3 prefix identifies 3 % characters to insert. You can use another number.</div> <div> The erlang.el code binds M-1 to indent-for-comment. However PEL uses M-1 for something else.<ul style="list-style-type: none">The M-; binding to comment-dwim works just as indent-for-comment if nothing is marked.</div>
	C-c C-c	(comment-region BEG END &optional ARG)	Comment or uncomment each line in the region. <ul style="list-style-type: none">With just C-u prefix arg, uncomment each line in region BEG .. END.Numeric prefix ARG means use ARG comment characters.If ARG is negative, delete that many comment characters instead.
	<ul style="list-style-type: none">The comment start is identified by ‘comment-start’ and ‘comment-padding’; the comment end by ‘comment-end’ and ‘comment-padding’.By default, the ‘comment-start’ markers are inserted at the current indentation of the region, and comments are terminated on each line (even for syntaxes in which newline does not end the comment and blank lines do not get comments). This can be changed with ‘comment-style’.		
Un-comment region	C-c C-u	(uncomment-region BEG END &optional ARG)	Uncomment each line in the BEG .. END region. The numeric prefix ARG can specify a number of chars to remove from the comment delimiters.

Description	Keystroke	Function	Note
Toggle display of comments in buffer or active region See also: 🔗 Comments	<code><f11> ; ;</code>	(hide/show-comments-toggle &optional START END)	Toggle hiding/showing of comments in the active region or whole buffer. <ul style="list-style-type: none"> If the region is active, then toggle comments in the region. Otherwise, in the whole buffer.  Requires the hide-comnt.el package  PEL activates it with pel-use-hide-comnt
Filling Text See also: 🔗 Filling/Justification	<ul style="list-style-type: none"> Text wrapping and filling applies to all text in the Erlang buffer: code and comment. The auto-fill command will automatically wraps code and comments. <ul style="list-style-type: none"> Filling Erlang code does not work as it treats code as normal text. But filling comment paragraphs is useful. The fill-column variable controls where text wraps. <ul style="list-style-type: none"> pel-show-fill-column <f11> t f ? shows its value. Use set-fill-column (C-x f) to set it. Toggle a vertical line that shows it with <code><f11> 8</code>. 		
Fill current paragraph	<ul style="list-style-type: none"> M-q <code><f11> t f p</code> 	(fill-paragraph &optional JUSTIFY REGION)	Fill multi-line comment at or after point. <ul style="list-style-type: none"> To justify as well: C-u M-q In auto fill mode the text filling is done at the end of the line.
Indentation	All syntactic indentation control for Erlang is controlled by the CC-Mode logic and provided commands listed below. <ul style="list-style-type: none"> Rigid indentation commands are also available and listed at the end of this list. They are also listed in the 🔗 Indentation table. 		
Indent current line or region See also: 🔗 Indentation <i>Erlang Guidelines:</i> <ul style="list-style-type: none"> Ericsson AB: try to limit most code to 2 levels of indentation. Inaka: indentation level = 2 space chars. 	<code><tab></code>	(indent-for-tab-command &optional ARG)	Indent active region, current line, or block starting on this line.
<ul style="list-style-type: none"> The indentation level is controlled by the erlang-indent-level user-option. Its default is 4. <ul style="list-style-type: none"> Access its custom group buffer using <code><f12> <f3> 1</code> or <code><f11> SPC e <f3> 1</code>. Or use <code><f11> <f2> g erlang RET</code>. <code><tab></code> performs syntactic indentation. <ul style="list-style-type: none"> In Transient Mark mode, when the region is active, reindent the region. Otherwise, with a prefix argument, rigidly reindent the expression starting on the current line. Otherwise reindent just the current line. <p>👉 You can type <code><tab></code> <i>anywhere</i> in the line to indent the current line or everything in the marked area if a block is marked.</p> <ul style="list-style-type: none"> Note that the <code>erlang.el</code> logic doubles the indentation label inside funs. See this S.O. discussion on that. <p>👉 To <i>indent rigidly</i> you can use:</p> <ul style="list-style-type: none"> (pel-indent-rigidly &optional N) (bound to C-x <tab> and to <code><f11> <tab><tab></code>) to indent the line or region rigidly. (tab-to-tab-stop), bound to M-i to insert spaces to the next tab stop column. 			
Indent complete buffer	<code><f12> <tab></code>	(erlang-indent-current-buffer)	Indent current buffer as Erlang code. <ul style="list-style-type: none"> Works on the entire buffer, even if it is narrowed.
Indent Erlang function	C-c C-q <code><f12> f <tab></code>	(erlang-indent-function)	Indent current Erlang function. Point can be located anywhere inside the function.
Indent function clause	<code><f12> c <tab></code>	(erlang-indent-clause)	Indent current Erlang clause. Point can be located anywhere in the Erlang clause.
Indent lines of list after point See also: 🔗 Indentation	C-M-q	(prog-indent-sexp &optional DEFUN)	Indent the expression after point. When interactively called with prefix, indent the enclosing function instead.
Indent a region	C-M-\	(indent-region START END &optional COLUMN)	Indent each nonblank line in the region. <ul style="list-style-type: none"> A numeric prefix argument specifies a column: indent each line to that column. With no prefix argument, the command chooses one of these methods and indents all the lines with it: <ol style="list-style-type: none"> If ‘fill-prefix’ is non-nil, insert ‘fill-prefix’ at the beginning of each line in the region that does not already begin with it. If ‘indent-region-function’ is non-nil, call that function to indent the region. Indent each line via ‘indent-according-to-mode’. <p>👉 When a region is marked you can also use the simple <code><tab></code> to do the same when syntactic-indentation is active.</p>
Navigation in Erlang code See also: <ul style="list-style-type: none"> 🔗 Navigation Moving by Defuns 	The <code>erlang-mode</code> provides commands to navigate across Erlang source code. PEL complements these. And EDTS also. Several commands are specialization of the normal navigation commands which are described in the table 🔗 Navigation , but several are specific to Erlang: <ul style="list-style-type: none"> Notice the 3 sets of commands: <ol style="list-style-type: none"> <code><f12> <up></code> and <code><f12> <down></code> move to the beginning of Erlang functions skipping all compiler directives. The standard navigation commands, (mapped to <code><f6></code> prefix) move to beginning/end of Erlang functions but stop at compiler directives. The <code><f12> <M-cursor></code> commands (also accessible via <code><M-f12> <M-cursor></code>, move across Erlang clauses (as opposed to functions). The list below describe the specialized commands only. See the others inside 🔗 Navigation , like the navigation by blocks. <p>👉 Note that all <code><f12></code> prefixes shown below are available in <code>erlang-mode</code>. Their global equivalent is <code><f11> SPC e</code>. It is not always shown for brevity.</p> <p>👉 Some navigation examples use icons to represent point position. The start position is shown as  with following positions as  to .</p>		
• By Function	<ul style="list-style-type: none"> Move to next/previous function beginning/end at/skipping compiler directives. Skips clauses. 		
• to start of function	<ul style="list-style-type: none"> Move to beginning of function 		
• Go backward to beginning of previous function	<ul style="list-style-type: none"> <code><f12> <up></code> <code><f12> f p</code> 	(pel-previous-erl-function &optional N)	Move backward to the beginning of the previous function skipping all compiler directives. <ul style="list-style-type: none"> Moves point to the first character of the function name. With prefix argument N repeat N times. Pushes mark; move back to previous position with M-`. <p>➡ Shift marking is available for the key sequence using a cursor key.</p>
	C-c C-d C-b	(ferl-goto-previous-function)	Move backward to the beginning of the previous function. <ul style="list-style-type: none"> Skips all compiler directives.  Requires EDTS  PEL activates it with pel-use-edts (set to t or start-automatically).
• Go forward to beginning of next function	<ul style="list-style-type: none"> <code><f12> <down></code> <code><f12> f n</code> 	(pel-next-erl-function &optional N)	Move forward to the beginning of the next function skipping all compiler directives. <ul style="list-style-type: none"> Moves point to the first character of the function name. With prefix argument N repeat N times. Pushes mark; move back to previous position with M-`. <p>➡ Shift marking is available for the key sequence using a cursor key.</p>
	C-c C-d C-f	(ferl-goto-next-function)	Move forward to the beginning of the next function. <ul style="list-style-type: none"> Skips all compiler directives.  Requires EDTS  PEL activates it with pel-use-edts (set to t or start-automatically).
• to start of function/directive	<ul style="list-style-type: none"> Move to beginning of function or compiler directive 		
• Go backward to beginning of previous: • function • compiler directive	<code><f12> f P</code>	(beginning-of-defun &optional ARG)	Move backward to the beginning of an Erlang function or compiler directive. <ul style="list-style-type: none"> With ARG, do it that many times. Negative ARG means move forward to the ARGth following beginning of defun. <p>➡ Shift marking is available in graphics mode, not in terminal mode (for C-M-a and C-M-<home>). However <code><f6> p</code> and <code><f6> <up></code> handle Shift-marking fine in terminal mode.</p> <p>🐛 Erlang.el man page indicates an invalid mapping for this.</p>
	<ul style="list-style-type: none"> C-M-a C-M-<home> <code><f6> p</code> <code><f6> <up></code> <code><f11> SPC e f P</code> 	(erlang-beginning-of-function &optional ARG)	
• Go forward to beginning of next: • function • compiler directive	<code><f12> f N</code>	(pel-beginning-of-next-defun &optional SILENT DONT-PUSH_MARK)	Move forward to the beginning of the next function definition or compiler directive. <ul style="list-style-type: none"> Beeps if does not find beginning of next function unless SILENT is non-nil. If the beginning of next function is found, push the start location to the mark ring unless DONT-PUSH_MARK is non-nil. <ul style="list-style-type: none"> Move back to previous position with M-`. <p>➡ Shift marking is available for the <code><f6></code> bindings.</p>
	<ul style="list-style-type: none"> <code><f6> n</code> <code><f6> <down></code> <code><f11> SPC e f N</code> 		
• to end of function	<ul style="list-style-type: none"> Move to end of function or compiler directive 		

Description	Keystroke	Function	Note
<ul style="list-style-type: none"> Backward to end of previous: <ul style="list-style-type: none"> function compiler directive 	<f6> <left>	(pel-end-of-previous-defun &optional SILENT DONT-PUSH_MARK)	Move backwards to line after end of the previous function definition. <ul style="list-style-type: none"> Beeps if does not find end of previous function unless SILENT is non-nil. If the end of previous function is found, push the start location to the mark ring unless DONT-PUSH_MARK is non-nil. <ul style="list-style-type: none"> Move back to previous position with M-`. ➡Shift marking is available for the <f6> bindings.
<ul style="list-style-type: none"> Forward to end of next: <ul style="list-style-type: none"> function compiler directive 	<ul style="list-style-type: none"> C-M-e C-M-<end> <f6> <right> 	(end-of-defun &optional ARG) (erlang-end-of-function &optional ARG)	Move forward to line after end of Erlang function. With argument, do it that many times. Negative argument -N means move back to Nth preceding end of defun. ➡Shift marking is available in graphics mode, not in terminal mode (for C-M-e and C-M-<end>). However <f6> <right> handle Shift-marking fine in terminal mode.
<ul style="list-style-type: none"> By Expression functions, etc.. 	Note that in Erlang every single expression or expression sequence ends with a period. Expressions in expression sequences are separated by commas. The following commands move to the beginning/end of single expression or expression sequence. <ul style="list-style-type: none"> They do not move across expressions in a sequence of expressions. Since Erlang function definition is also an Erlang expression, these commands move across function definitions. 		
<ul style="list-style-type: none"> Go to beginning of statement 	M-a <f12> s a	(backward-sentence &optional ARG)	Go backward to the beginning of an Erlang statement. <ul style="list-style-type: none"> With a numerical argument repeat that many times.
<ul style="list-style-type: none"> Go to end of statement 	M-e <f12> s e	(forward-sentence &optional ARG)	Go forward to the end of an Erlang statement. <ul style="list-style-type: none"> With a numerical argument repeat that many times.
By Function Clause	Move by clauses of a function. A function definition (statement) may have multiple clauses, each separated by a semicolon.		
<ul style="list-style-type: none"> Go backward to beginning of clause 	<ul style="list-style-type: none"> C-c M-a <f12> c a <M-f12> <M-up> 	(erlang-beginning-of-clause &optional ARG)	Move backward to previous start of clause. <ul style="list-style-type: none"> With argument, do this that many times. 🐛Erlang.el man page indicates an invalid mapping for this. Reported as ERL-1314.
<ul style="list-style-type: none"> Go forward to beginning of next clause 	<ul style="list-style-type: none"> <f12> c n <M-f12> <M-down> 	(pel-beginning-of-next-clause)	Move forward to the beginning of next clause. <ul style="list-style-type: none"> Pushes mark; move back to previous position with M-`. ➡Shift marking is available.
<ul style="list-style-type: none"> Go backward to end of previous clause 	<ul style="list-style-type: none"> <f12> c p <M-f12> <M-left> 	(pel-end-of-previous-clause)	Move backward to the end of the previous clause. <ul style="list-style-type: none"> Pushes mark; move back to previous position with M-`. ➡Shift marking is available.
<ul style="list-style-type: none"> Go forward to end of current clause 	<ul style="list-style-type: none"> C-c M-e <f12> c e <M-f12> <M-right> 	(erlang-end-of-clause &optional ARG)	Move to the end of the current clause. <ul style="list-style-type: none"> With argument, do this that many times. 🐛Erlang.el man page indicates an invalid mapping for this. Reported as ERL-1314.
<ul style="list-style-type: none"> Block Navigation See also: <ul style="list-style-type: none"> ⌘ Smartparens 	Erlang syntax uses balanced blocks made out of the following character pairs, generically called <i>block parens</i> : <ul style="list-style-type: none"> () for function parameters, expression grouping { } for tuples, records, maps [] for lists " " for strings << >> for binaries and bitstrings 🚧Experimental support in PEL. Under development. The smartparens-mode can be activated automatically for Erlang by adding erlang-mode to the pel-erlang-activates-minor-modes user-option. Use the <f11> ((key sequence to toggle the smartparens-mode on and off. Standard Erlang support provide some commands to navigate across and into these balanced blocks. Their name is shown in black in the following rows. <ul style="list-style-type: none"> Other commands are provided by ⌘ Smartparens when smartparens-mode minor-mode is active. Some are PEL specializations of smartparens code. 		
To Block start/end	The following commands move to the beginning or end of a block, skipping over Erlang terms inside these blocks.		
<ul style="list-style-type: none"> Go backward to beginning of previous block Skips terms. 	C-M-p	(backward-list &optional ARG)	Move backward to beginning of previous block. <ul style="list-style-type: none"> Supports blocks of (), [] and {}. With ARG, do it that many times. A negative argument N means forward-list N. This command assumes point is not in a string or comment. <pre> -spec ejabberd_started⁶() -> ok. ejabberd_started⁵() -> gen_server:call⁴(?MODULE, ejabberd_started, ?CALL_TIMEOUT). -spec config_reloaded³() -> ok. config_reloaded²() -> gen_server:call¹(?MODULE, config_reloaded, ?CALL_TIMEOUT).⁰</pre>
<ul style="list-style-type: none"> Go backward to end of previous block Skips terms. ⌘ Smartparens with smartparens-mode active 	<M-f7> p	(pel-sp-previous-sexp &optional ARG)	Move backward to end of previous block. <ul style="list-style-type: none"> With ARG, do it that many times. If there is no next expression at current level, jump one level up (effectively doing 'sp-up-sexp'). A negative argument N means move to the end of N-th following balanced expression. <pre> -spec ejabberd_started()⁶ -> ok. ejabberd_started()⁵ -> gen_server:call(?MODULE, ejabberd_started, ?CALL_TIMEOUT)⁴. -spec config_reloaded()³ -> ok. config_reloaded()² -> gen_server:call(?MODULE, config_reloaded, ?CALL_TIMEOUT)¹.⁰</pre>

After M-2 <M-f7> t: AList = [[10,11,12, [22,33,44]], 5, {first, [1, 2, 3]} , 6, 7, 8, []].</p> <p>Before (for all following examples): AList = [{first, [1, 2, 3]} , [10,11,12, [22,33,44]], 5, 6, 7, 8, []]. After M- - <M-f7> t: AList = [{first, [1, 3 , 2]}, [10,11,12, [22,33,44]], 5, 6, 7, 8, []].</p>
Push current block after next <ul style="list-style-type: none"> Smartparens with smartparens-mode active 	<M-f7> s	(sp-push-hybrid-sexp)	Push the hybrid sexp after point over the following one. <p>Before: AList = [1, 2, 3, [10,11,12, [22,33,44]], 5, 6, 7, 8, []].</p> <p>After <M-f7> s: AList = [1, 2, 3, 5, 6, 7, 8, [], [10,11,12, [22,33,44]]].</p>
The following commands perform slurping operations, however support for Erlang could be improved as the commands do not always work properly.			
Enclose next outside element into current block <ul style="list-style-type: none"> Smartparens with smartparens-mode active 	<M-f7> >	(sp-forward-slurp-sexp &optional ARG)	Add sexp following the current list in it by moving the closing delimiter. <ul style="list-style-type: none"> If the current list is the last in a parent list, extend that list (and possibly apply recursively until we can extend a list or end of file). If ARG is N, apply this function that many times. If ARG is negative -N, extend the opening pair instead (that is, backward). If ARG is raw prefix C-u, extend all the way to the end of the parent list. If both the current expression and the expression to be slurped are strings, they are joined together. <p>⚠ This command does not always work well for Erlang as shown in the first example.</p> <ul style="list-style-type: none"> Use the next command for Erlang in those cases. <p>Before: Names = []Joe.</p> <p>After <M-f7> >: Names = [Joe.] % ⚠</p> <p>Before: AList = [[1, 2, 3], 4, 5].</p> <p>After <M-f7> >: AList = [[1, 2, 3 4,], 5]. % ⚠</p> <p>Before: AList = [1, 2, 3, [10,11,12, [22,33,44]], 5, 6, 7, 8, []].</p> <p>After M-- <M-f7> >: AList = [1, 2, [3, 10,11,12, [22,33,44]], 5, 6, 7, 8, []].</p>
	<M-f7> M->	(sp-slurp-hybrid-sexp)	This commands works a little differently and handles some Erlang statement better, but not all. <p>Before: Names = []Joe.</p> <p>After <M-f7> M->: Names = [Joe].</p> <p>Before: AList = [[1, 2, 3], 4, 5].</p> <p>After <M-f7> M->: AList = [[1, 2, 3 4,], 5]. % ⚠</p>
Enclose previous outside element(s) into next block	<M-f7> <	(sp-backward-slurp-sexp &optional ARG)	Add the sexp preceding the current list in it by moving the opening delimiter. <ul style="list-style-type: none"> If the current list is the first in a parent list, extend that list (and possibly apply recursively until we can extend a list or beginning of file). If arg is N, apply this function that many times. If arg is negative -N, extend the closing pair instead (that is, forward). If ARG is raw prefix C-u, extend all the way to the beginning of the parent list. If both the current expression and the expression to be slurped are strings, they are joined together. <p>The position of point inside the list does not matter. The point does not move.</p> <p>Before: AList = [0, 1, [2, 3 , 4], 5].</p> <p>After <M-f7> <: AList = [0, [1, 2, 3, 4], 5].</p> <p>Before: AList = [0, 1, [2, 3 , 4], 5].</p> <p>After M-2 <M-f7> <: AList = [[0, 1, 2, 3 , 4], 5].</p> <p>Before: AList = [-2, -1, 0, 1, [2, 3, 4], 5].</p> <p>After C-u <M-f7> <: AList = [[-2, -1, 0, 1, 2, 3, 4], 5].</p>
Enclose next element(s) into previous block <ul style="list-style-type: none"> Smartparens with smartparens-mode active ⚠ 	<M-f7>]	(sp-add-to-previous-sexp &optional ARG)	Add the expression around point to the first list preceding point. <ul style="list-style-type: none"> With ARG positive N add that many expressions to the preceding list. If ARG is raw prefix argument C-u add all expressions until the end of enclosing list to the previous list. If ARG is raw prefix argument C-u C-u add the current list into the previous <p>Before: AList = [0, 1, [2, 3], 4, 5].</p> <p>After <M-f7>]: AList = [0, 1, [2, 3 4,] 5]. % ⚠</p> <p>Before: AList = [0, 1, [2, 3], 4, 5].</p> <p>After M-2 <M-f7>]: AList = [0, 1, [2, 3 4,]5],. % ⚠</p>
Enclose previous outside element(s) into next block <ul style="list-style-type: none"> Smartparens with smartparens-mode active 	<M-f7> [(sp-add-to-next-sexp &optional ARG)	Add the expressions around point to the first list following point. <ul style="list-style-type: none"> With ARG positive N add that many expressions to the following list. If ARG is raw prefix argument C-u add all expressions until the beginning of enclosing list to the following list. If ARG is raw prefix argument C-u C-u add the current list into the following list. <p>This command works fine in Erlang for the following code examples:</p> <p>Before: AList = [1, 2, [3, 4]].</p> <p>After <M-f7> [: AList = [1, [2, 3, 4]].</p> <p>Before: AList = [1, 2, [3, 4]].</p> <p>After C-u <M-f7> [: AList = [[1, 2, 3, 4]].</p> <p>Before: AList = [[1, 2], [3, 4]].</p> <p>After C-u C-u <M-f7> [: AList = [[[1, 2], 3, 4]].</p>

Description	Keystroke	Function	Note
Transform - barf	The following commands extract members from block		
Eject next element(s) out of current block <ul style="list-style-type: none"> ⌘ Smartparens with smartparens-mode active ⚠ 	<M-f7> /	(sp-forward-barf-sexp &optional ARG)	Remove the last sexp in the current list by moving the closing delimiter. <ul style="list-style-type: none"> If ARG is positive number N, barf that many expressions. If ARG is negative number -N, contract the opening pair instead. If ARG is raw prefix C-u, barf all expressions from the one after point to the end of current list and place the point before the closing delimiter of the list. If the current list is empty, do nothing.
		⚠ The forward command does not seem to work properly for Erlang as shown by the following examples:	Before: AList = [[1, 2, 3, 4]]. After <M-f7> /: AList = [[1, 2, 3,] 4]. % ⚠
Eject previous element(s) out of current block <ul style="list-style-type: none"> ⌘ Smartparens with smartparens-mode active 	<M-f7> M-/	(sp-backward-barf-sexp &optional ARG)	This is exactly like calling 'sp-forward-barf-sexp' with minus ARG. <ul style="list-style-type: none"> In other words, instead of contracting the closing pair, the opening pair is contracted. For more information, see the documentation of 'sp-forward-barf-sexp'.
		This command works fine in Erlang for the following code examples:	Before: AList = [[1, 2, 3, 4]]. After <M-f7> M-: AList = [1, [2, 3, 4]]. Before: AList = [[1, 2, 3, 4]]. After M-3 <M-f7> /: AList = [1, 2, 3, [4]].
Re-wrap block	Use the following commands to change the wrapping character pair surrounding a block		
Re-wrap current block <ul style="list-style-type: none"> ⌘ Smartparens with smartparens-mode active 	<M-f7> r	(sp-rewrap-sexp PAIR &optional KEEP-OLD)	Re-wrap current block using another block character. Prompt for the pair beginning character. <ul style="list-style-type: none"> With C-u, keep old delimiter and wrap with PAIR on the outside of the current expression.
		This command works fine in Erlang for the following code examples:	Before: AList = [[1, 2, 3, 4]]. After <M-f7> r {: AList = [{1, 2, 3, 4}] Before: AList = [[1, 2, 3, 4]]. After C-u <M-f7> r {: AList = [{[1, 2, 3, 4]}]
Swap current block and parent block wrapping characters <ul style="list-style-type: none"> ⌘ Smartparens with smartparens-mode active 	<M-f7> w	(sp-swap-enclosing-sexp &optional ARG)	Swap the enclosing delimiters of this and the parent expression. <ul style="list-style-type: none"> With N > 0 numeric argument, ascend that many levels before swapping.
		This command works fine in Erlang for the following code examples:	Before: AList = ({[1, 2, 3, 4]}). After <M-f7> w: AList = ({[1, 2, 3, 4]}). Before: AList = ({[1, 2, 3, 4]}). After <M-f7> w: AList = [{[1, 2, 3, 4]}].
Un-wrap block			
Extract all elements from current/next block <ul style="list-style-type: none"> ⌘ Smartparens with smartparens-mode active 	<M-f7> U	(sp-unwrap-sexp &optional ARG)	Un-wrap current or next block. <ul style="list-style-type: none"> With ARG N, unwrap Nth expression as returned by 'sp-forward-sexp'. If ARG is negative -N, unwrap Nth expression backwards as returned by 'sp-backward-sexp'.
		This command works fine in Erlang for the following code examples:	Before: AList = [1, 2, 3, 4]]. After <M-f7> U: AList = [1, 2, 3, 4]]. Before: AList = ({[1, 2, 3, 4]}). After <M-f7> U: AList = ({1, 2, 3, 4}).
		Before: AList = [1, 2, [3, 4], 5, [6, 7], 8].	After <M-f7> U: AList = [1, 2, 3, 4, 5, [6, 7], 8].
		Before: AList = [1, 2, [3, 4], 5, [6, 7], 8].	After M-2 <M-f7> U: AList = [1, 2, [3, 4], 5, 6, 7, 8].
Extract all elements from previous block <ul style="list-style-type: none"> ⌘ Smartparens with smartparens-mode active 	<M-f7> W	(sp-backward-unwrap-sexp &optional ARG)	Unwrap the previous block. Unwrap the previous expression. With ARG N, unwrap Nth expression as returned by 'sp-backward-sexp'. If ARG is negative -N, unwrap Nth expression forward as returned by 'sp-forward-sexp'.
		This command works fine in Erlang for the following code examples:	Before: AList = ({[1, 2, 3, 4]}). After <M-f7> W: AList = ({1, 2, 3, 4}). Again After <M-f7> W: AList = (1, 2, 3, 4). Again After <M-f7> W: AList = 1, 2, 3, 4.
		Before: AList = [0, 1, [2, 3, 4], 5].	After <M-f7> W: List = [0, 1, 2, 3, 4, 5].
		Before: AList = [1, 2, [3, 4], 5, [6, 7], 8].	After <M-f7> W: AList = [1, 2, [3, 4], 5, 6, 7, 8].
Before: AList = [1, 2, [3, 4], 5, [6, 7], 8]. After M-2 <M-f7> W: AList = [1, 2, 3, 4, 5, [6, 7], 8].			
Split & Join			
Split block <ul style="list-style-type: none"> ⌘ Smartparens with smartparens-mode active ⚠ 	<M-f7>	(sp-split-sexp ARG)	Split the list or string the point is on into two. <ul style="list-style-type: none"> If ARG is a raw prefix C-u split all the sexps in current expression in separate lists enclosed with delimiters of the current expression.
		Before: AList = [1, 2, [3, 4, 5, 6, 7], 8].	After <M-f7> : AList = [1, 2, [3, 4,] [5, 6, 7], 8]. % ⚠
		Before: Name = "Joe Armstrong".	After <M-f7> : Name = "Joe " "Armstrong".
		Before: AList = [1, 2, [3, 4, 5, 6, 7], 8].	After C-u <M-f7> : AList = [1, 2, [3], [4], [5], [6], [7], 8].

Description	Keystroke	Function	Note
Join blocks <ul style="list-style-type: none"> » Smartparens with smartparens-mode active 	<M-f7> J	(sp-join-sexp &optional ARG)	Join the blocks before and after point if they are of the same type. <ul style="list-style-type: none"> If ARG is positive N, join N expressions after the point with the one before the point. If ARG is negative -N, join N expressions before the point with the one after the point. If ARG is a raw prefix C-u join all the terms up until the end of current expression. The joining stops at the first expression of different type.
		Before: AList = [0, 1, [2, 3, 4] , [5, 6], 7]. After <M-f7> J: AList = [0, 1, [2, 3, 4 , 5, 6], 7].	
Search Support	In Erlang mode, the superword mode can be useful since snake_case is often used. Using superword-mode helps searching. PEL activates the superword mode by default in Erlang mode. To change this use the <f11> t <f2> to access the customize buffer.		
<u>Toggle superword-mode</u> See also: <ul style="list-style-type: none"> » Text Modes » Search/Replace 	<f12> M-p <ul style="list-style-type: none"> <f11> t m p <f11> SPC e M-p 	(superword-mode &optional ARG)	Toggle superword-mode: a minor mode that treats snake_case as one word. In Erlang, ‘_’ are treated as part of words. <ul style="list-style-type: none"> With a prefix argument ARG, enable superword mode if ARG is positive, and disable it otherwise. PEL provides the <f12> M-p key for the programming language modes where snake_case is popular (Emacs Lisp, C, C++, Erlang, Python, etc...)
Marking	The following Erlang-mode specific marking functions are available. They complement what is already available and described in the » Marking table. For those 2 commands the 🐛 Erlang.el man page indicates an invalid mapping for this. Reported as ERL-1314 .		
Mark Erlang function	<ul style="list-style-type: none"> C-M-h <f12> f m 	(mark-defun &optional ARG) (erlang-mark-function &optional ARG)	Put mark at end of this function, point at beginning. <ul style="list-style-type: none"> The function marked is the one that contains point or follows point. With positive ARG, mark this and that many next functions; with negative ARG, change the direction of marking. If the mark is active, it marks the next or previous function(s) after the one(s) already marked.
Mark Erlang Clause	<ul style="list-style-type: none"> C-c M-h <f12> c m 	(erlang-mark-clause)	Put mark at end of clause, point at beginning.
<u>iEdit mode</u> See also: » Highlight	iEdit Mode - Edit multiple instances of variable/symbols simultaneously. 🍌 This mode is very useful to rename symbols or variable during refactoring. 📦 Requires the iedit external package. 🧑🏻‍🔧 PEL activates it with pel-use-iedit .		
<u>Toggle iedit mode</u> See also: <ul style="list-style-type: none"> » Cursor » Search/Replace 	<ul style="list-style-type: none"> C-; <f11> e <f11> h i <f11> m i 	(iedit-mode &optional ARG)	Toggle iEdit mode: edit all symbols in scope or region simultaneously. <ul style="list-style-type: none"> ⚠️ Both iEdit and Flyspell use the C-; key as their default binding. PEL detects and reports that situation: modify the binding of one of them if you see it. ► See » Search/Replace where all the iedit-mode commands are described.
Highlighting blocks	The following commands can be used to activate or toggle useful modes to highlight blocks of (), {}, and []. <ul style="list-style-type: none"> show-paren-mode, which highlights the parens that matches the one before or after point. rainbow delimiters mode, where matching nested parens are highlighted with the same colour. 		
<u>Toggle show-paren mode on/off</u> See also: » Highlight	<ul style="list-style-type: none"> <f12> M-9 <M-f12> M-9 	(show-paren-mode &optional ARG)	Toggle visualization of matching parens (Show Paren mode). <ul style="list-style-type: none"> With a prefix argument ARG, enable Show Paren mode if ARG is positive, and disable it otherwise. Show Paren mode is a global minor mode. When enabled, any matching parenthesis is highlighted in ‘show-paren-style’ after ‘show-paren-delay’ seconds of Emacs idle time.
<u>Enable/Disable coloured highlight of nested blocks (), {}, []</u> See also: » Highlight	<ul style="list-style-type: none"> <f12> M-r <M-f12> M-r 	(rainbow-delimiters-mode &optional ARG)	Highlight nested parentheses, brackets, and braces with different colours according to their depth. <ul style="list-style-type: none"> Customize the depth and colours with M-x customize-group rainbow-delimiters 📦 Requires: rainbow-delimiters.el 🧑🏻‍🔧 PEL activates this when the pel-use-rainbow-delimiters user option is set to t .
Inserting code with	Specialized Tempo Skeletons		
Insert Parentheses	M- ((insert-parentheses &optional ARG)	For Erlang: insert a parenthesis pair ‘()’, leaving point after open-paren. <ul style="list-style-type: none"> A positive ARG encloses the following ARG sexps in parenthesis if they are balanced. A negative ARG encloses the preceding ARG sexps instead. No argument is equivalent to zero: just insert ‘()’ and leave point between. PEL makes ‘parens-require-spaces’ buffer local and set it to nil in Erlang mode buffers, allowing the use of this command to insert the argument parentheses following a function (and without placing a space between the function name and the opening parenthesis. If region is active, insert enclosing characters at region boundaries. This command assumes point is not in a string or comment.
<u>Insert Erlang Code Templates</u> See also: <ul style="list-style-type: none"> » Inserting Text for more info and information about tempo skeleton and the completely different yasnippet template-based text insertion). 	The erlang.el external package defines a set of text skeletons using the standard tempo skeleton package. <ul style="list-style-type: none"> The erlang package make these skeletons available on the Erlang/Skeletons menu (via <f10>). PEL provides the following additional functionality: <ul style="list-style-type: none"> Quick access keys to insert the templates, all mapped under the pel:erlang-skel key prefix: <f12> <f12>. Several additional templates. These are marked with a +. These are also added to the menu. 🧑🏻‍🔧 Several aspects of the PEL Erlang Source Code Style is controlled by the user options inside the pel-erlang-code-style group. The controlled templates affected are marked with a C. The relevant user options are part of the pel-erlang-code-style group accessible with <f12> <f2> from an erlang mode buffer and include the following options: <ul style="list-style-type: none"> pel-erlang-skel-insert-file-timestamp : set whether an automatically updated timestamp is inserted in the file header block. pel-erlang-skel-prompt-for-purpose : set whether file and function skeletons blocks prompt for purpose and insert it. pel-erlang-skel-prompt-for-function-name : set whether function skeletons prompt for function name and then inserts that name. pel-erlang-skel-prompt-for-function-arguments : set whether function skeletons prompt for function arguments and then insert them. pel-erlang-use-separators : set whether blocks use horizontal separator lines (these are the first of potentially 2 separators). pel-erlang-use-secondary-separators : set whether blocks use a second block horizontal separator line. pel-erlang-skel-with-edoc : set whether generated code comments use EDoc markup. pel-erlang-skel-with-license : set whether file header blocks use open source software license text controlled by 🧑🏻‍🔧 lice. 🍌 Emacs user options by default take effect globally. But by using file and directory variables (see » File/Directory Variables) they can also be used to take effect on a single file or all files inside a directory tree. So by default, the user options that control the PEL tempo template take effect globally. If you want to change the behaviour for only one file, write the user option control block at the end of that file. If you want to control the behaviour of the PEL tempo templates for all files inside a directory tree create a .dir-locals file and store the values of the relevant options variables inside that file. This allows you to control the user options affecting the format of the tempo templates precisely and does not affect what you actually type. <ul style="list-style-type: none"> Once a skeleton was just entered (or later by activating the pel-tempo-mode) you can move to the next or previous point of interest (so called <i>tempo-marks</i>) with the standard tempo-mode keys C-c M-f and C-c M-b or some other keys like C-c . and C-c ,. Instead of using the <f12> <f12> bindings, you can also type the template name and then hit C-c C-M-i or <f12> <f12> <f12>. This supports listing all completions into a separate temporary buffer. This is mainly useful for templates which short names such as “if”, “case”, etc... 		
+ : additional templates C : templates with customization control	🍌 Some of the template names in the title column are also links to the relevant Erlang language construct reference page. 🔗 Note that all <f12> prefixes shown below are available in erlang-mode. Their global equivalent is <f11> SPC e . It is not always shown for brevity.		
» <u>Customize</u> PEL Erlang Skeletons layout	<f12> <f12> <f2>	(pel-customize-pel &optional OTHER-WINDOW)	Customize PEL Erlang skeleton layout. <ul style="list-style-type: none"> If OTHER-WINDOW is non-nil (use C-u), display in another window.
<u>if</u>	<f12> <f12> i	(pel-erl-if)	Insert an if statement.
<u>case</u>	<f12> <f12> c	(pel-erl-case)	Insert a case expression.
<u>export</u> +	<f12> <f12> x	(pel-erl-export	Insert an export module attribute expression.

Description	Keystroke	Function	Note
import +	<f12> <f12> I	(pel-erl-import)	Insert an import module attribute expression.
try +	<f12> <f12> t	(pel-erl-try)	Insert a try expression.
try-of +	<f12> <f12> T	(pel-erl-try-of)	Insert a try expression with of clauses.
receive	<f12> <f12> r	(pel-erl-receive)	Insert a receive expression.
after	<f12> <f12> a	(pel-erl-after)	Insert a receive expression with an after (timeout) clause.
loop	<f12> <f12> l	(pel-erl-loop)	Insert a simple receive loop.
module	<f12> <f12> m	(pel-erl-module)	Insert the module attribute.
function C	<f12> <f12> f	(pel-erl-function)	Insert a function definition. This may prompt for function name, argument and purpose according to the user options described above. All prompts maintain independent histories.
author	<f12> <f12> `	(pel-erl-author)	Insert the author attribute. Uses the user-mail-address user option to insert your mail address.
spec	<f12> <f12> s	(pel-erl-spec)	Insert a -spec for the function following point.
small-header C	<f12> <f12> M-h	(pel-erl-small-header)	Insert a small file header without any comment.
normal-header C	<f12> <f12> M-H	(pel-erl-normal-header)	Insert a normal file header: includes author name, copyright notice, doc section, file created date
large-header C	<f12> <f12> h	(pel-erl-large-header)	Insert a large header block that includes all normal header fields plus separators. <ul style="list-style-type: none"> All formatting is controlled by user-options described above. Distinguish Erlang .erl module files from the .hrl header files.
small-server C	<f12> <f12> M-s	(pel-erl-small-server)	Insert a large file header and template logic for a small server.
application C	<f12> <f12> M-a	(pel-erl-application)	Insert a large file header and template logic for an application behaviour .
supervisor C	<f12> <f12> M-u	(pel-erl-supervisor)	Insert a large file header and template logic for a supervisor behaviour .
supervisor-bridge C	<f12> <f12> M-b	(pel-erl-supervisor-bridge)	Insert a large file header and template logic for a supervisor bridge behaviour .
generic-server C	<f12> <f12> M-g	(pel-erl-generic-server)	Insert a large file header and template logic for a gen-server behaviour .
gen-event C	<f12> <f12> M-e	(pel-erl-gen-event)	Insert a large file header and template logic for a gen-event behaviour .
gen-fsm C	<f12> <f12> M-f	(pel-erl-gen-fsm)	Insert a large file header and template logic for a gen-fsm behaviour .
gen-statem-StateName C	<f12> <f12> M-S	(pel-erl-gen-statem-StateName)	Insert a large file header and template logic for a gen-statem behaviour .
gen-statem-handle-event C	<f12> <f12> M-E	(pel-erl-gen-statem-handle-event)	Insert a large file header and template logic for a gen-statem.
wx-object C	<f12> <f12> M-w	(pel-erl-wx-object)	Insert a large file header and template logic for a wx-object generic server.
gen-lib C	<f12> <f12> M-l	(pel-erl-gen-lib)	Insert a large file header and template logic for a library module.
gen-corba-cb C	<f12> <f12> M-c	(pel-erl-gen-corba-cb)	Insert a large file header and template logic for a CORBA callback module.
ct-test-suite-s	<f12> <f12> M-1	(pel-erl-ct-test-suite-s)	Insert a large file header and template logic for a test suite
ct-test-suite-l	<f12> <f12> M-2	(pel-erl-ct-test-suite-l)	Insert a large file header and template logic for a test suite
ts-test-suite	<f12> <f12> M-3	(pel-erl-ts-test-suite)	Insert a large file header and template logic for a test suite
Tempo Template Tag Insertion	<ul style="list-style-type: none"> C-c C-M-i <f12> <f12> <f12> <f11> SPC e <f12> <f12> 	(tempo-complete-tag &optional SILENT)	<p>Look for a tag and expand it.</p> <p>👉 Instead of using the <f12> <f12> key bindings above, you can type the template name (shown in the title column like “if”, “case”, etc) completely or partially and then hit C-c C-M-i. (or <f12> <f12> <f12>) A completion buffer opens up if the template name is incomplete (or empty in which case the buffer lists all available template names). Select the template name and hit RET. Emacs expands the template.</p> <ul style="list-style-type: none"> All the tags in the tag lists in ‘tempo-local-tags’ (this includes ‘tempo-tags’) are searched for a match for the text before the point. The way the string to match for is determined can be altered with the variable ‘tempo-match-finder’. If ‘tempo-match-finder’ returns nil, then the results are the same as no match at all. If a single match is found, the corresponding template is expanded in place of the matching string. If a partial completion or no match at all is found, and SILENT is non-nil, the function will give a signal. If a partial completion is found and ‘tempo-show-completion-buffer’ is non-nil, a buffer containing possible completions is displayed.
Toggle pel-tempo-mode See also: • 🔗 Inserting Text	<ul style="list-style-type: none"> <f12> <f12> SPC <f11> SPC e <f12> SPC <f6> SPC 	(pel-tempo-mode &optional ARG)	<p>Toggle PEL tempo mode on/off. PEL tempo mode activates C-c . and C-c , , as well as C-c C- . and C-c C- , key bindings to navigate across tempo mark hot-spots. When pel-tempo-mode is active the pel-tempo-mode lighter (⚡) is shown on the status bar. The second set are only available when Emacs runs in graphics mode.</p> <p>👉 When a skeleton is inserted via the execution of one of the pel-erl-... commands above, the pel-tempo-mode is automatically activated.</p>
Jump to next tempo mark	<ul style="list-style-type: none"> C-c M-f C-c . C-c C-. 	(tempo-forward-mark)	<p>Jump to the next mark in ‘tempo-back-mark-list’: the location where code must be updated inside the inserted skeleton.</p> <ul style="list-style-type: none"> These key bindings are only available when pel-tempo-mode is active.

Delete region	<M-f7> DEL -	(sp-delete-region BEG END)	Delete the text between point and mark, like ‘delete-region’. <ul style="list-style-type: none"> BEG and END are the bounds of region to be deleted. If that text is unbalanced, signal an error instead. With a prefix argument, skip the balance check.
Kill region	<M-f7> - -	(sp-kill-region BEG END)	Kill the text between point and mark, like ‘kill-region’. <ul style="list-style-type: none"> BEG and END are the bounds of region to be killed. If that text is unbalanced, signal an error instead. With a prefix argument, skip the balance check.
	<M-f7> - r	(sp--kill-or-copy-region BEG END &optional DONT-KILL)	Kill or copy region between BEG and END according to DONT-KILL. <ul style="list-style-type: none"> If ‘evil-mode’ is active, copying a region will also add it to the 0 register. Additionally, if command was prefixed with a register, copy the region to that register
Delete char forward	<M-f7> DEL n	(sp-delete-char &optional ARG)	<pre>(quu x "zot") -> (quu "zot") (quux "zot") -> (quux " zot") -> (quux " ot") (foo () bar) -> [(foo bar)] (foo bar) -> (foo bar)</pre>
Delete char backward	<M-f7> DEL p	(sp-backward-delete-char &optional ARG)	<pre>("zot" q uux) -> ("zot" uux) ("zot" quux) -> ("zot " quux) -> ("zo " quux) (foo () bar) -> (foo bar) (foo bar) -> (foo bar)</pre>

Description	Keystroke		Function	Note
EDTS	EDTS - Erlang Development Tool Suite  The commands in the following rows require the EDTS external package .  PEL activates it when the pel-use-edts user option is set to t . If you want EDTS to start automatically when you open an Erlang file, set pel-use-edts to start-automatically instead of t .			
Erlang Project settings	 EDTS is customizable through it edts customization group. With PEL you can open it, with other Erlang specific groups with <f12> <f3> . EDTS also uses an external .edts configuration file to store Erlang project specific settings. See EDTS: Configure your projects . This allows setting the following: project name, node-name, erlang-cookie, lib-dirs, start-command, top-path, dialyzer-plt, app-include-dirs, project-include-dirs, xref-error-whitelist, xref-file-whitelist			
See also: Sessions	 Desktop restoration often fails when edts-mode was active on session stored: unfortunately edts does not provide a desktop restore handler. <ul style="list-style-type: none"> PEL does, however provide a desktop restore handler for EDTS which detects edts-mode failures and protect the desktop restoration.  If EDTS has not been activated yet, the only EDTS specific key available is <f12> M-SPC to activate it. Once it's activated the other keys are available.			
Toggle EDTS mode	<f12> M-SPC <f11> SPC e M-SPC	(edts-mode &optional ARG)	Turn EDTS mode on or off. <ul style="list-style-type: none">EDTS is an easy to set up Development-environment for Erlang.EDTS also incorporates a couple of other minor-modes, currently auto-highlight-mode and auto-complete-mode. They are configured to work together with EDTS but see their respective documentation for information on how to configure their behaviour further.	
EDTS/Navigation	EDTS (see below) provides 2 commands to move point across Erlang functions: <code>ferl-goto-previous-function</code> and <code>ferl-goto-next-function</code> . They are listed above in the navigation section. The EDTS navigation functions do not support repetition prefix argument nor they support shift marking. There are other commands and key bindings to move across Erlang functions, and PEL support functions that perform the same and support repetition and shift marking. See the commands listed in the navigation section above.			
EDTS/Cross References	EDTS provides the following cross-reference commands. It supports navigating in Erlang source code running in the current and remote nodes.  Note that all <f12> prefixes shown below are available in erlang-mode. Their global equivalent is <f11> SPC e . It is not always shown for brevity.			
Find definition of identifier at point	M-.	(edts-find-source-under-point)	Goto the source code that: defines the function being called at point or header file included at point. For remote calls, contacts an Erlang node to determine which file to look in, with the following algorithm: <ul style="list-style-type: none">Find the directory of the module's beam file (loading it if necessary).Look for the source file in:<ul style="list-style-type: none">Directory where source file was originally compiled.Todo: Same directory as the beam fileTodo: Again with <code>/ebin/</code> replaced with <code>/src/</code>Todo: Again with <code>/ebin/</code> replaced with <code>/erl/</code> Otherwise, report that the file can't be found.	
Go back to where M-. was last issued	M-,	(edts-find-source-unwind)	Unwind back from uses of 'edts-navigate'-commands.	
Lists caller of function at point	<ul style="list-style-type: none">C-c C-d w<f12> w	(edts-xref-who-calls)	Pops-up a menu of all callers of the function at point.	
List the callers again	<ul style="list-style-type: none">C-c C-d W<f12> W	(edts-xref-last-who-calls)	Redo previous call to edts-who-calls.	
Find a function in the current module	<ul style="list-style-type: none">C-c C-d f<M-f12> M-f	(edts-find-local-function SET-MARK)	Find a function in the current module. <ul style="list-style-type: none">List local functions in the mini-buffer. Support completion. Move point to selected one.With C-u prefix, push mark before moving point.	
Find a module in the current project	<ul style="list-style-type: none">C-c C-d F<M-f12> M-g	(edts-find-global-function)	Find a module in the current project. <ul style="list-style-type: none">List project modules in the mini-buffer. Support completion. Open the file of selected one.	
EDTS/AHS Editing	EDTS supports the automatic highlight symbol mode (AHS). and provides commands to modify the name of the highlighted name in the current function or in all of the buffer. The automatic symbol highlighting mode starts when the cursors stays on a symbol for a period longer than the value identified by the ahs-idle-interval which defaults to 1.0 second.  To turn off the AHS editing mode, use a command to move point away from the highlighted area.			
Edit all highlighted symbols in current function	<ul style="list-style-type: none">C-c C-d e<f12> e	(edts-ahs-edit-current-function)	Once a symbol is highlighted, use this command to start editing all instances of this symbol in the current function. <ul style="list-style-type: none">Activates ahs-edit-mode with edts-current-function range-plugin.	
Edit all highlighted symbols in buffer	<ul style="list-style-type: none">C-c C-d E<f12> E	(edts-ahs-edit-buffer)	Once a symbol is highlighted, use this command to start editing all instances of this symbol in the current buffer. <ul style="list-style-type: none">Activates ahs-edit-mode with ahs-range-whole-buffer range-plugin.	
Move to the next highlighted symbol	<f12> n	(ahs-forward)	Once a symbol is highlighted, move forward to the next highlighted symbol.	
Move to the previous highlighted symbol	<f12> p	(ahs-backward)	Once a symbol is highlighted, move forward to the previous highlighted symbol.	
Move to the originally highlighted symbol	<f12> .	(ahs-back-to-start)	Once a symbol is highlighted, move back to the symbol that was highlighted at the start of that highlight session.	
Refactor: replace region by call to function and add a new function	<ul style="list-style-type: none">C-c C-d r<f12> r	(edts-refactor-extract-function NAME START END)	Refactor the expression(s) in the region as a function. <ul style="list-style-type: none">The expressions are replaced with a call to the new function, and the function itself is placed on the kill ring for manual placement. The new function's argument list includes all variables that become free during refactoring - that is, the local variables needed from the original function.New bindings created by the refactored expressions are *not* exported back to the original function. Thus this is not a "pure" refactoring.This command requires Erlang syntax tools package to be available in the node, version 1.2 (or perhaps later.)	
EDTS/Man	EDTS supports opening documentation for a specific function using the information extracted from Erlang Man pages. EDTS maintains a set of Erlang man pages per project, so it is possible to have several Erlang projects each one with a different version of Erlang and their corresponding man pages. These EDTS commands complement the Emacs standard man commands described above in this table.			
Download, install, select Erlang Man pages	<f12> `	(edts-man-setup)	Download and install OTP man-pages that will be used by the following 2 EDTS commands.	
Display help for function at point	<ul style="list-style-type: none">C-c C-d h<f12> h	(edts-show-doc-under-point)	Find and display the man-page documentation for function under point in a tooltip.	
Find and show man-page info for an Erlang module:function	<ul style="list-style-type: none">C-c C-d H<f12> H	(edts-find-doc)	Prompts for a module, then a function. Find and show the man-page documentation for the Erlang module:function.	
EDTS Code Analysis				
Compile current buffer	<f12> a c	(edts-code-compile-and-display)	Compiles current buffer on node related to that buffer's project.	
Run eunit tests	<ul style="list-style-type: none">C-c C-d t<f12> a t	(edts-code-eunit &optional COMPILATION-RESULT)	Runs eunit tests for current buffer on node related to that buffer's project.	
Run dialyzer	<f12> a a	(edts-dialyzer-analyze)	Runs dialyzer for all live buffers related to current buffer either by belonging to the same project or, if current buffer does not belong to any project, being in the same directory as the current buffer's file.	

Description	Keystroke	Function	Note
EDTS/Debug			
Toggle breakpoint	<ul style="list-style-type: none">C-c C-d b<f12> d b	(edts-debug-toggle-breakpoint)	Toggle breakpoint on current line.
List breakpoints	C-c C-d M-b <f12> d B	(edts-debug-list-breakpoints &optional SHOW)	Show a listing of all breakpoint on all nodes registered with EDTS. If optional argument SHOW is nil or omitted, don't display process list buffer. If it is pop call 'pop-to-buffer', if it is switch call 'switch-to-buffer'.
List Erlang processes	<ul style="list-style-type: none">C-c C-d M-p<f12> d p	(edts-debug-list-processes &optional SHOW)	Show a listing of all processes on all nodes registered with EDTS. If optional argument SHOW is nil or omitted, don't display process list buffer. If it is pop call 'pop-to-buffer', if it is switch call 'switch-to-buffer'.
Toggle interpretation state of module	<ul style="list-style-type: none">C-c C-d i<f12> d i	(edts-debug-toggle-interpreted)	Toggle the interpretation state for module in current buffer.
List interpreted modules	<ul style="list-style-type: none">C-c C-d M-i<f12> d I	(edts-debug-list-interpreted &optional SHOW)	Show a listing of all interpreted modules on all nodes registered with EDTS. If optional argument SHOW is nil or omitted, don't display interpreted list buffer. If it is pop call 'pop-to-buffer', if it is switch call 'switch-to-buffer'.
EDTS/Erlang Node			
Display EDTS Erlang Node Name	<f12> N	(edts-buffer-node-name)	Print the node sname of the erlang node connected to current buffer. <ul style="list-style-type: none">The node is either:<ul style="list-style-type: none">The module's project node, if current buffer is an erlang module, orThe buffer's erlang node if buffer is an edts-shell buffer.The project-node of the buffer that was current buffer before jumping to the current buffer if the file of the current buffer is located outside any project (eg. an "externally" loaded module such as an otp-module or a module loaded by ~/.erlang).
Start an EDTS controlled Erlang Shell	<f12> x	(edts-shell &optional PWD SWITCH-TO)	Start an interactive erlang shell.
Start EDTS server	<f12> X	(edts-api-start-server)	Starts an edts server-node in a comint-buffer (if not already running).
LSP support: <ul style="list-style-type: none">lsp-modeerlang_ls	LSP (language Server Protocol) support for Erlang is provided via: <ul style="list-style-type: none"> The lsp-mode Emacs Lisp external package PEL activates it when the pel-use-erlang-ls user-option is turned on (set to t).The erlang_ls Erlang server for LSP. You must install this manually. You will need Git, Erlang, rebar3 and make. The instructions are on the web-site.<ul style="list-style-type: none"> The erlang_ls can be configured using a YAML file erlang_ls.config file that must be placed at the root of the Erlang project. <p> It's important for most projects to set that up, otherwise you may not be able to take advantage of several of the cross-reference features</p>		
<ul style="list-style-type: none">erlang_ls required environment	The following executable must be accessible from PATH: <ul style="list-style-type: none">erl_есrіpt and other Erlang executables. See Installing Erlang if you need to learn how to install Erlang and its tools.erlang_ls. To install erlang_ls follow the instruction on the erlang_ls GitHub page: git clone it, then run make and make install.and the various Tools for Erlang.		
<ul style="list-style-type: none"> Customize lsp-mode	Several lsp-mode settings are customizable in the lsp-mode customization group. With PEL you can access it via <f12> L <f3> . The following settings are probably what you may want to customize: <ul style="list-style-type: none">lsp-log-io : control whether the LSP process is logging its I/O. Useful for debugging LSP support.lsp-ui-sideline-enable : control whether LSP display information about the current code line.lsp-ui-doc-enable : control whether LSP display documentation about the current code symbol. You can also use the PEL commands to modify them dynamically using the following commands.		
Toggle code documentation display	<f11> SCP e L D	(pel-toggle-lsp-ui-doc &optional LOCALLY)	Toggle the display of code documentation. <ul style="list-style-type: none">The initial state is set by the 'lsp-ui-doc-enable' user-option.By default this command impact is global unless an argument prefix is specified, in which case it is applied to the current buffer only.
	<f12> L D		
Toggle LSP I/O logging	<f11> SCP e L I	(pel-toggle-lsp-log-io &optional LOCALLY)	Toggle the logging of LSP I/O. <ul style="list-style-type: none">The initial state is set by the 'lsp-log-io' user-option.By default this command impact is global unless an argument prefix is specified, in which case it is applied to the current buffer only.
	<f12> L I		
Toggle display of information on current line	<f11> SCP e L L	(pel-toggle-lsp-ui-sideline &optional LOCALLY)	Toggle the display of information of the current line. <ul style="list-style-type: none">The initial state is set by the 'lsp-ui-sideline-enable' user-option.By default this command impact is global unless an argument prefix is specified, in which case it is applied to the current buffer only.
	<f12> L L

lsp-mode integrations see also: <ul style="list-style-type: none"> Completion/Input Treemacs Hide/Show	lsp-mode supports integration with: <div><div><ul style="list-style-type: none"> Helm by using helm-lsp Ivy by using lsp-ivy treemacs by using lsp-treemacs origami by using lsp-origami</div><div> PEL activates when pel-use-helm-lsp is turned on. PEL activates when pel-use-lsp-ivy is turned on. PEL activates when pel-use-lsp-treemacs is turned on. PEL activates when pel-use-lsp-origami is turned on.</div></div>		
LSP key bindings: <ul style="list-style-type: none">lsp-modeerlang_ls See also: <ul style="list-style-type: none"> Input Method	Key bindings: The lsp-mode is a minor mode and provides customizable prefix key for its key bindings. The default key prefix is s-1 . <ul style="list-style-type: none">Since the super modifier key is not always available, it can be modified through customization: change the lsp-keymap-prefix value. This can be done with M-x <code>customize-option</code> or with PEL via the <f11> <f2> o key sequence.<ul style="list-style-type: none">With PEL, the following keys are good replacement candidates: <f9> and C-1 . If you use <f9> for Greek letters then consider using <M-f9>.The key bindings shown below show the standard s-1 key prefix.<ul style="list-style-type: none">If you change lsp-keymap-prefix that would be replaced with your selected prefix key.		
Display LSP workspace log buffer	s-1 L	(lsp-workspace-show-log WORKSPACE)	Display the log buffer of WORKSPACE.
Validate LSP performance settings	s-1 d	(lsp-doctor)	Validate performance settings and write report in a *lsp-performance* buffer.
Reformat Erlang file	s-1 = =	(lsp-format-buffer)	Ask the server to format this document.

Description	Keystroke	Function	Note
Add directory to the list of workspace folders	s-1 F a	(lsp-workspace-folders-add PROJECT-ROOT)	Add PROJECT-ROOT to the list of workspace folders. <ul style="list-style-type: none"> Prompts for the directory.
Remove a directory from the workspace blacklist	s-1 F b	(lsp-workspace-blacklist-remove PROJECT-ROOT)	Remove PROJECT-ROOT from the workspace blacklist.
Remove directory from the list of workspace folders	s-1 F r	(lsp-workspace-folders-remove PROJECT-ROOT)	Remove PROJECT-ROOT from the list of workspace folders.
Find Identifier definitions	s-1 G g	(lsp-ui-peek-find-definitions &optional EXTRA)	Find definitions to the IDENTIFIER at point.
Find symbol implementation locations	s-1 G i	(lsp-ui-peek-find-implementation &optional EXTRA)	Find implementation locations of the symbol at point.
Find references	s-1 G r	(lsp-ui-peek-find-references &optional INCLUDE-DECLARATION EXTRA)	Find references to the IDENTIFIER at point.
Find symbols	s-1 G s	(lsp-ui-peek-find-workspace-symbol PATTERN &optional EXTRA)	Find symbols in the workspace. The symbols are found matching PATTERN.
Toggle diagnostic modeline	s-1 T D	(lsp-modeline-diagnostics-mode &optional ARG)	Toggle diagnostics modeline.
Toggle LSP protocol logging	s-1 T L	(lsp-toggle-trace-io)	Toggle client-server protocol logging.
Toggle current-line status information	s-1 T S	(lsp-ui-sideline-mode &optional ARG)	Minor mode for showing status information for current line. <ul style="list-style-type: none"> Displays code status such as definition errors, etc...
Toggle code action on modelling	s-1 T a	(lsp-modeline-code-actions-mode &optional ARG)	Toggle code actions on modeline.
Toggle headline breadcrumbs	s-1 T b	(lsp-headerline-breadcrumb-mode &optional ARG)	Toggle breadcrumb on headerline. <ul style="list-style-type: none"> When active the list of directories are listed on the header line. In graphics mode these are buttons you can use to change directory.
Toggle hover information	s-1 T d	(lsp-ui-doc-mode &optional ARG)	Minor mode for showing hover information in child frame. <ul style="list-style-type: none"> When active, information about symbol at point is shown in a pop-up overlay area. In graphics mode the information has links that can be used to open web-located information. For small window the information may cover too much code, use this command to toggle in and out of view. Also note that when the point is toward the bottom of a window the information window may not show completely and you may have to scroll your window.
Toggle symbol highlighting	s-1 T h	(lsp-toggle-symbol-highlight)	Toggle symbol highlighting.
Toggle code-lens	s-1 T l	(lsp-lens-mode &optional ARG)	Toggle code-lens overlays. <ul style="list-style-type: none"> Code-lens show information like # times a specific function is referenced.
Execute code action	s-1 a a	(lsp-execute-code-action INPUT)	Execute code action ACTION. <ul style="list-style-type: none"> If ACTION is not set it will be selected from 'lsp-code-actions-at-point'. Request codeAction/resolve for more info if server supports.
Highlight all relevant references to symbol at point	s-1 a h	(lsp-document-highlight)	Highlight all relevant references to the symbol under point.
Click LSP lens via avy	s-1 a l	(lsp-avy-lens)	Click lsp lens using 'avy' package. <ul style="list-style-type: none"> The code lens must be active. Use s-1 T l to activate it if it's not active.
Apropos search for symbol/regexp	s-1 g a	(xref-find-apropos PATTERN)	Find all meaningful symbols that match PATTERN. <ul style="list-style-type: none"> Can be used to search symbol outside project. The argument has the same meaning as in 'apropos'. The result is shown in a *xref* buffer.
Find definitions of symbol at point	s-1 g g	(lsp-find-definition &key DISPLAY-ACTION)	Find definitions of the symbol under point.
Find implementations of symbol at point	s-1 g i	(lsp-find-implementation &key DISPLAY-ACTION)	Find implementations of the symbol under point.
Find references of symbol at point	s-1 g r	(lsp-find-references &optional INCLUDE-DECLARATION &key DISPLAY-ACTION)	Find references of the symbol under point. <ul style="list-style-type: none"> The result is shown in a *xref* buffer.
Trigger display hover information	s-1 h g	(lsp-ui-doc-glance)	Trigger display hover information popup and hide it on next typing.
Display documentation of symbol at point in *lsp-help*	s-1 h h	(lsp-describe-thing-at-point)	Display the type signature and documentation of the thing at point. <ul style="list-style-type: none"> Display help about symbol at point inside a *lsp-help* buffer. <ul style="list-style-type: none"> 👉 Useful in terminal mode as you can navigate inside the buffer and used other functions to open identified URL references.
Refactor source import	s-1 r o	(lsp-organize-imports)	Perform the source.organizeImports code action, if available.
Rename symbol at point See also: 🔗 Search/Replace	s-1 r r	(lsp-rename NEWNAME)	Rename the symbol (and all references to it) under point to NEWNAME. <ul style="list-style-type: none"> 👉 For renaming the arguments of a function, the iedit mode is more appropriate. It supports restricting the scope to the current function. See 🔗 Search/Replace
Disconnect LSP	s-1 w D	(lsp-disconnect)	Disconnect the buffer from the language server.
Describe LSP session	s-1 w d	(lsp-describe-session)	Describes current 'lsp-session'. <ul style="list-style-type: none"> Show available tools and the available capabilities Shows the information inside a LspBrowser buffer.
Shut LSP workspace down	s-1 w q	(lsp-workspace-shutdown WORKSPACE)	Shut the workspace WORKSPACE and the language server associated with it
Restart LSP workspace	s-1 w r	(lsp-workspace-restart WORKSPACE)	Restart the workspace WORKSPACE and the language server associated with it

Description	Keystroke	Function	Note
Activate LSP	s-1 w s	(lsp &optional ARG)	Entry point for the server startup. <ul style="list-style-type: none"> When ARG is t the lsp mode will start new language server even if there is language server which can handle current language. When ARG is nil current file will be opened in multi folder language server if there is such. When 'lsp' is called with prefix argument ask the user to select which language server to start.
Treemacmacs support <ul style="list-style-type: none"> Σ x Treemacs 	<div>  The treemacs and lsp-treemacs external packages  respectively activated by PEL user-options pel-use-treemacs and pel-use-lsp-treemacs, provide extra features that help Erlang development. When these are activated PEL provides bindings for the lsp-treemacs features. </div> <div>  Configure lsp-treemacs by accessing the lsp-treemacs customization group. With PEL use <f12> w <f3> from an Erlang buffer. </div>		
<ul style="list-style-type: none"> Open LSP Treemacs error list window. 	<f12> w e	(lsp-treemac s -error s -list)	Display an error list window at the bottom of the frame. <ul style="list-style-type: none"> The buffer uses the treemacs-mode and supports its commands and key bindings. See Σ x Treemacs for the list of commands and key bindings. To close the window, kill its buffer with C-x k
<ul style="list-style-type: none"> Quick fix 	x	(lsp-treemac s -quick-fix &rest ARGS)	If possible, proposes a quick code fix for the error at point.
<ul style="list-style-type: none"> Open LSP Treemacs symbol window 	<f12> w s	(lsp-treemac s -symbol s)	Show symbols view. <ul style="list-style-type: none"> To close the window, kill its buffer with C-x k
<ul style="list-style-type: none"> Open LSP Treemacs references window 	<f12> w x	(lsp-treemac s -reference s ARG)	Show the references for the symbol at point. Issue from an Erlang buffer. <ul style="list-style-type: none"> With a prefix argument, select the new window and expand the tree of references automatically. To close the window, kill its buffer with C-x k
<ul style="list-style-type: none"> Open LSP Treemacs implementations window 	<f12> w i	(lsp-treemac s -implementation s ARG)	Show the implementations for the symbol at point. Issue this command from an Erlang buffer. <ul style="list-style-type: none"> With a prefix argument, select the new window expand the tree of implementations automatically. To close the window, kill its buffer with C-x k
<ul style="list-style-type: none"> Open LSP Treemacs call hierarchy window 	<f12> w c	(lsp-treemac s -call-hierarchy OUTGOING)	Show the incoming call hierarchy for the symbol at point. <ul style="list-style-type: none"> With a prefix argument, show the outgoing call hierarchy.  This does not seem to have been implemented for Erlang.
<ul style="list-style-type: none"> Open LSP Treemacs type hierarchy window 	<f12> w t	(lsp-treemac s -type-hierarchy DIRECTION)	Show the type hierarchy for the symbol at point. <ul style="list-style-type: none"> With prefix 0 show sub-types. With prefix 1 show super-types. With prefix 2 show both.  This is not implemented for Erlang.
Rendering markup embedded in comments	The following commands are used to create images from specific markup code embedded inside Erlang source code comments. This can be useful when using these markup languages to describe UML diagrams or finite-state machines for example.		
Preview UML diagram from plantUML source in current plantUML region of commented source code	<f12> u <f11> SCP e u	(pel-render-commented-plantuml PREFIX &optional POS)	Render the PlantUML markup embedded in current mode comment. <ul style="list-style-type: none"> Use region if identified otherwise use PlantUML block at point. Uses prefix (as PREFIX) to choose where to display it: <ul style="list-style-type: none"> 4 (when prefixing the command with C-u) -> new window 16 (when prefixing the command with C-u C-u) -> new frame. else -> new buffer This can be used inside buffer using any major mode, when PlantUML markup is embedded inside source code comment.
See also: M PlantUML	 Use this in source code to describe your code architecture with PlantUML markup, then generate the UML rendering by moving point inside the PlantUML block and issuing this command.		
	 Requires the plantuml-mode external package,  activated by pel-use-plantuml user option being non-nil.

Fast pace. A must see. A great presentation to show people that may be reluctant to use the technology.</div> The Do's and Don'ts of Error Handling • Joe Armstrong • GOTO 2018
Erlang References	
Erlang Reference Manual User's Guide	The official Erlang language reference. Lists the BIFs (Built-in functions), reserved words, and all language reference info.
A Concise Guide to Erlang	A very nice quick reference. From David Matuszek, University of Pennsylvania
Erlang Code Guidelines	
Erlang Programming Rules and Conventions	Official Ericsson AB Erlang guidelines.
Inaka's Erlang Coding Standards & Guidelines	Guideline used at Inaka, published on Github.
EDoc User's Guide	Describes how to document code.

Document	Notes
Erlang Books	There are several printed and online Erlang books. Erlang's FAQ lists several of them. The following lists some extra ones.
Adopting Erlang	A great and recent (2019 and later) online books on Erlang Development that provides information not available in the Erlang introduction books. Describes how to install Erlang, and how to setup editing tools. A must read to setup Erlang development. This is still work in progress as of May 2020. Each page has a date time stamp.
Erlang Information Sites	
How to setup a local Erlang & Elixir dev environment on Mac from source	LambdaCat post on August 2015. Describes how to use Kerl to install Erlang. Also describes tools to install Elixir. However to get kerl on a macOS machine, using Homebrew is simpler.
<ul style="list-style-type: none"> about-erlang trying-erlang 	<p>These are 2 projects of mine, that I am currently building to centralize some information on Erlang.</p> <ul style="list-style-type: none"> about-erlang provides general information about Erlang, including: <ul style="list-style-type: none"> Learning Erlang , a table with links to resources to learn Erlang. Installing Erlang, describes various ways to install Erlang on macOS. Tools for Erlang, describes tools you can use for Erlang development. 🛠️
Emacs and Erlang Man files	
How to create a local whatis file	Show how to create a missing whatis file for a set of man pages.
<ul style="list-style-type: none"> The Erlang mode for Emacs (user guide) Erlang mode for Emacs (man page) 	<p>On the erlang.org site. Start here. Describes the 2 files (erlang.el and erlang-start.el) provided by the Erlang mode support, how to set them up for various operating systems. Note, however, that PEL provides the setting for you. It also provides an overview of the various features the package provides.</p> <ul style="list-style-type: none"> 🐛 I found bugs in the erlang man page in the Edit- Moving the marker section. 1) it's the point that is moved, not the marker, 2) C-a is not an Emacs key prefix, so their key binding descriptions like C-a M-a and C-a M-e are invalid. Reported as ERL-1314. There's missing information in this. I will identify later as I find out how to get the system going. One aspect to learn more is related to the various erlang-electric functions and variables. The variable erlang-electric-commands was set to (erlang-electric-comma erlang-electric-semicolon erlang-electric-gt) at first, which does not include the erlang-electric-newline function. I tried adding erlang-electric-newline and activated it, but that made things worse: the newline was no longer automatic after a -> on a function definition line. Another issue: inside the OS-level erlang shell, we can tab-completion a module:function string, but that does not work inside the emacs erlang shell.
Emacs tools for Erlang	
EDTS	<p>EDTS: stands for: The Erlang Development Tool Suite. See also:</p> <ul style="list-style-type: none"> EDTS Tool Suite - Making Your Life Easier - Thomas Järvrstrand presentation @ Youtube EDTS: <ul style="list-style-type: none"> configure your project One Primary EDTS node 1 node per open project To setup an Erlang project: a .edts file in the project: <pre>:name "my-project" :otp-path "path/to/otp" :node-name "project-node-name" :lib-dirs '("lib" "deps")</pre>
<ul style="list-style-type: none"> How to install EDTS 	<p>Describes some aspects of EDTS and links that may be useful. Lists the requirements.</p> <p>⚠️🛠️After installing EDTS, I got several compile errors, and had to install the following other modules:</p> <p>- auto-complete (v1.5.1) - have to read doc and configure. And perhaps disable company mode?</p>

Using Tags with Erlang	
Etags with Erlang @ erlang.org	Describes how to use tags with Erlang source code and how to create the TAGS file.
Troubleshooting	This section describes how to solve some of the problems you may encounter with Erlang on Emacs.
How to prevent Erlang shell echo	On some systems the Erlang shell annoyingly echoes every command typed at the shell. The Emacs manual describes a method to prevent shells inside Emacs from echoing and it describes it as affecting Windows systems. None of the Emacs shells on my system that runs on macOS echo commands, but the Erlang shell does. And the described fix works. PEL activates the fix if the pel-erlang-shell-prevent-echo is set to t . To activate after setting it: execute pel-init or restart Emacs.
