

# Emacs Tree Sitter Support 🚧

Operation	Keystroke	Function	Note
<b>Tree-Sitter Support</b>  <div>Last updated on: 2025-10-08</div>	Emacs supports Tree-Sitter syntax parsing since Emacs 29. <ul style="list-style-type: none"><li>Emacs 30 introduced a breaking change in the way built-in major modes implement tree-sitter support.<ul style="list-style-type: none"><li>Because of that change PEL supports Tree-sitter on <b>Emacs &gt;= 30</b> only.</li></ul></li></ul> PEL provides extra key binding for operations related to tree sitter when Emacs >= 30 is build with tree-sitter support		
<b>Open this PDF file.</b> See also: <a href="#">🔗 Help/Info</a>	<b>&lt;f11&gt; C-t &lt;f1&gt;</b>	<b>(pel-treesit-help</b> &optional OPEN-WEB-PAGE)	Open the <a href="#">🔗 Tree-Sitter</a> local PDF. If the prefix argument (like <b>C-u</b> or <b>M--</b> ) is used, then it opens the remote GitHub hosted raw PDF instead. If the <b>pel-flip-help-pdf-arg</b> user-option is set it's the other way around.
<a href="#">🔗 Customize</a> PEL tree-sitter control	<b>&lt;f11&gt; C-t &lt;f2&gt;</b>	<b>(pel-treesit-customize</b> &optional OTHER-WINDOW)	Customize PEL support for: open the pel-pkg-for-tree-sitter customization group buffer in current window. <ul style="list-style-type: none"><li>If OTHER-WINDOW is non-nil (use <b>C-u</b>), display in other window.</li></ul>
<a href="#">🔗 Customize</a> Emacs tree-sitter control	<b>&lt;f11&gt; C-t &lt;f3&gt;</b>	<b>(pel-treesit-emacs-customize</b> &optional OTHER-WINDOW)	Customize Emacs tree-sitter support: open the trees it group buffer in current window. <ul style="list-style-type: none"><li>If OTHER-WINDOW is non-nil (use <b>C-u</b>), display in other window.</li></ul>
<b>Toggle the tree-sitter explore minor mode.</b>	<b>&lt;f11&gt; C-t e</b>	<b>(treesit-explore-mode</b> &optional ARG)	Enable exploring the current buffer's syntax tree. <ul style="list-style-type: none"><li>Pops up a window showing the syntax tree of the source in the current buffer in real time. The corresponding node enclosing the text in the active region is highlighted in the explorer window.</li><li>This is a minor mode. If called interactively, toggle the 'Treesit-Explore mode' mode. If the prefix argument is positive, enable the mode, and if it is zero or negative, disable the mode.</li><li>If called from Lisp, toggle the mode if ARG is 'toggle'. Enable the mode if ARG is nil, omitted, or is a positive number. Disable the mode if ARG is a negative number.</li></ul>
<b>Toggle tree-sitter inspection mode</b>	<b>&lt;f11&gt; C-t i</b>	<b>(treesit-inspect-mode</b> &optional ARG)	Minor mode that displays in the mode-line the node which starts at point. <ul style="list-style-type: none"><li>When this mode is enabled, the mode-line displays  PARENT FIELD-NAME: (NODE FIELD-NAME: (CHILD (...)))  where NODE, CHILD, etc, are nodes which begin at point.<ul style="list-style-type: none"><li>PARENT is the parent of NODE. NODE is displayed in bold typeface.</li><li>FIELD-NAMES are field names of NODE and CHILD, etc (see Info node '(elisp)Language Grammar', heading "Field names").</li></ul></li><li>If no node starts at point, i.e., point is in the middle of a node, then the mode line displays the earliest node that spans point, and its immediate parent.</li><li>This minor mode doesn't create parsers on its own. It uses the first parser in 'treesit-parser-list'.</li><li>This is a minor mode. If called interactively, toggle the 'Treesit-Inspect mode' mode. If the prefix argument is positive, enable the mode, and if it is zero or negative, disable the mode.</li></ul>
<b>Tree-Sitter based packages</b>	Some packages are using the tree-sitter parsing to implement features not specific to major modes. These packages are describe below. All of these packages require tree-sitter support. Therefore PEL support them on <b>Emacs &gt;= 30</b> only.		
<a href="#">Combobulate</a>  🚧	📦 The <a href="#">combobulate</a> external package is used by PEL when the <a href="#">🔗 pel-use-combobulate</a> user-option is set to t. <ul style="list-style-type: none"><li>Since combobulate is still under early development it is not available on MELPA. PEL installs it via <a href="#">quelpa</a> and installs <a href="#">quelpa</a> first if it's not already present. <a href="#">quelpa</a> creates a combobulate elpa-compliant package from combobulate Github git repo and stores it inside the ~/.emacs.d/elpa directory.</li><li>Once installed if you want to upgrade combobulate to what is now available in the combobulate Git repo, execute the <a href="#">quelpa-upgrade combobulate</a> command</li></ul>
