Special Legend for the above table

Alternate key binding. Use those for secondary macOS computers remotely accessed through macOS Screen Sharing . This way, by putting the Screen Sharing program window in full screen mode, you can change desktop on the remote computer using these keyboard shortcuts that are unused in the current (main) macOS computer. This works only when the computer that is sharing its screen runs one of the latest macOS versions . I have tested it on servers running: macOS 14.2.1 - Sonoma It does not work on server running: macOS 10.14.6 - Mojave system, and use it remotely with the mouse to select the appropriate desktop.
To be able to assign key shortcuts to switch to multiple desktops: • first create the desktops, • restart macOS and then • configure macOS MissionControl key shortcuts.
Feature only available in latest macOS versions.
Feature available in older macOS versions (such as Mojave) that have been discontinued in recent ones (such as Sonoma).
Keys I reserve to start and stop event/key recordings performed by some software like Bartels Media Macro Recorder . I use this to create event sequences to help me test my software. Infortunately I have not yet found a macOS key recorder/player that properly handles the macOS numpad keys events seen by EmacS running inside macOS Terminal.app.
