File Management

<u>Operation</u>	<u>Keystroke</u>	Function	<u>Note</u>
File Handling See also: Dired Eustomize Evey-Chords Tramp (edit remote) Features: open file open file at point ffap commands Recently opened open modes (read-only, root, binary) Fuzzy file finder Dired (directory editor) Activate URLs in buffer Insert text from file Write text to file Reverting file Save to file, Rename Inserting copyright Automatic time stamp RFC mode Directory tree browsers Treemacs/ZTree Mode-specialized open	content, displaying directions. There are also severated to the content of the c	ctory content, etc These are all Emacs internal and external prize system to modify their validation of the relevant user-option in with the following Emacs built activated by pel-use-archiverctivated by pel-use-ffap to procitivated by pel-use-recent to all package and activated by pel-use of file save from the following extern activated by pel-use on file ration with the following extern activated by pel-use-key-activated by pel-use-key-activated by pel-use-could activated by pel-use-could activated by pel-use-could activated by pel-use-neotic activated by pel-use-neotic activated by pel-use-neotic activated by pel-use-received activated by pel-use-tree	rpm, provides ability to open RPM and CPIO archive files as you can do with tarball and zip files. wide several commands to open file at point.
Open this PDF file. See also: <u>ℤ Help/Info</u>	<f11> f <f1> 1</f1></f11>	(pel-help-pdf &optional OPEN-WEB-PAGE)	Open the $\underline{\mathbb{S}}$ File-mngt local PDF. If the prefix argument (like $\mathbf{C}-\mathbf{u}$ or $\mathbf{M}-\mathbf{-}$) is used, then open remote GitHub hosted raw PDF instead. If $\mathbf{pel-flip-help-pdf-arg}$ user-option is set it's the other way around
Customize PEL File/ Directory Management	<f11> f <f2> 1</f2></f11>	(pel-customize-pel &optional OTHER-WINDOW)	Customize PEL support for file management. • If OTHER-WINDOW is non-nil (use C-u), display in other window.
∑ Customize Emacs file management support	<f11> f <f3></f3></f11>	(pel-customize-library &optional OTHER-WINDOW)	Customize Emacs support for file management. Includes the following: files, fzf, recentf, popupswitcher, x509 (see <u>M. X.509 Certificates</u>).
Customize Emacs support for file revert	<f11> f r <f3></f3></f11>	(pel-customize-library &optional OTHER-WINDOW)	Customize Emacs support for file automatic revert management.
Customize ffap (find file at point)	<f11> f a <f3></f3></f11>	(pel-customize-library &optional OTHER-WINDOW)	Customize Emacs support for management of ffap (find file at point).
Show file mngt status	<f11> f ?</f11>	(pel-show-filemng-status)	Display status of various file management controls: encoding, resolving relative path method, etc
Open File in App	The following command	d opens file(s) outside Emacs, u	using OS applications registered with the file type. See: <u>E Dired</u> , <u>E Web</u>
Open currently file visited in current buffer with the default OS application.		(pel-open-buffer-file-in-os- app &optional FNAME) ed, prompt to save buffer first.	Open the file in the current buffer with the OS-registered application. If the current buffer holds a HTML file, that's a quick way to open the file in your browser.
Opening file		 s: open each marked files in its ds are available to open/visit file 	s S-registered applications, you can also type z to open the current file or all selected files. Some sin Emacs buffers. Note: Emacs uses the word "visiting" instead of "opening" files.
See <u>» Completion/Input.</u>	 For some of them the corresponding ido mode function is also shown. The command used to 'visit' a file, find-file is Emacs default. It supports Emacs' basic tab completion. Packages that support other completion mechanisms can be installed and activated and then the command uses a different completion mechanism. PEL customization system allows you to specify whether you want to use one or several other completion mechanisms. It also has a command to change the completion mechanism dynamically. You can change it without restarting Emacs or event re-executing pel-init. See the Completion/Input and Customize tables for more info. File Lock: Emacs protects against multiple processes modifying the same file with a lock. If you attempt to edit the buffer of a locked file, or save a buffer. 		
Open file-open dialog	of a locked file, Emacs	(ns-open-file-using-panel)	steal the lock (with 's'), 2) proceed ('p') to edit the file anyway or 3) quit ('q'). 6 On macOS in graphics mode only: open a file, select the file name via an OS File dialog.
Open (visit) a file/ directory See also:	• <f11> f f • M-<f11> M-f M-f • C-x C-f</f11></f11>	(find-file FILENAME &optional WILDCARDS)	Prompt for the file or directory name to open. Open the selected file/directory in a buffer with the appropriate mode. For directory, the buffer opens in Dired-mode. • With PEL, the <f11> f f and M-<f11> M-f M-f key bindings are always available, regardless of what completion mechanism is in use. It can be used as a fallback when testing various completion packages. I have seen some of them fail and break Ido. Note that M-<f12> M-f M-f is also available in some major modes to open files in a way that takes the major mode into account, like providing a list of files in the project. See major mode page:</f12></f11></f11>
•		(ido-find-file)	Same as above with Ido completion. See <u>Ecompletion/Input</u> for available completion modes.
path/to/file C-x C-f /su::/ path/to/file with C-f Change input completion method	 find-file is the original command and uses Emacs default completion. When Ido is used, the ido-find-file command is used instead. When ido mode is used, you can also: Type C-f or C-x f to change to original find-file mode and prevent Ido completion from trying to provide the name of an existing file when you want to specify the name of a file that does not exists yet. Type C-j to accept the file/directory name verbatim without replacement or suggestion. Also useful to open a directory in dired mode. To open a file in read-only mode you can: Use one of the commands below (C-x C-r, etc) Use C-x C-f then type C-x C-q to change the mode of the buffer to read-only mode. Control whether it opens file at point is opened by ido-use-filename-at-point user-option. Use <f11> f M to dynamically change it.</f11> Control whether it opens url at point by ido-use-url-at-point user-option. Use <f11> f M-, to dynamically change it.</f11> Use <f11> M-c <f4> to select another input completion method. See \(\subseteq \subse</f4></f11>		
Open file via popup menu	<f11> f M-f</f11>	(pel-psw-navigate-files)	Open file from a pop-up menu listing files in current directory. Uses (psw-navigate-files "."). Narrow menu list by typing part of the file name. You can also select directory names. Requires popup-switcher 2 PEL activates when pel-use-popup-switcher is t.
Open another file in buffer	C-x C-v	(find-alternate-file FILENAME &optional WILDCARDS) (ido-find-alternate-file)	Kills buffer and open the newly specified file in a new buffer same window. When ido-mode is used, the ido-find-alternate-file is used instead. Useful when just selected an empty file just selected by mistake.
Open file in other window	• C-x 4 f • <f11> f o</f11>	(find-file-other-window FILENAME &optional WILDCARDS) (ido-find-file-other- window)	Edit file FILENAME, in another window. • Like C-x C-f, but creates a new window or reuses an existing one.
Open file in other frame	C-x 5 f	(find-file-other-frame FILENAME & optional WILDCARDS) (ido-find-file-other-frame)	Edit file FILENAME, in another frame. • Like C-x C-f, but creates a new frame or reuses an existing one.
Open same file in other	• <f11> f M-d</f11>	(pel-open-file-in-other-dir)	Open file of same name as current one present in another directory.
directory Use it to open same	• M- <f11> M-f</f11>	,	of the directory of currently visited file using the default completion mechanism ('ido' by default).

<u>Operation</u>	<u>Keystroke</u>	Function	Note Note
Set whether ido-find-file	<f11> f M</f11>	(pel-set-ido-use-fname-at- point &optional GLOBALLY)	Enable or disable Ido ability to open URL at point with C-x C-f and other ids commands. Control behaviour in local buffer by default. Use command prefix to control it globally. This is not persistent. User option ido-use-file-at-point controls persistent setting.
uses filename at point See also: <u>See Completion/Input</u>			Set it to one of: disabled: don't use filename at point. guess: try to identify an exiting file name from the name at point. literal: use name at point in the Ido search for a file name.
† Set whether ido-find-file uses URL at point	<f11> f M-,</f11>	(pel-set-ido-use-url-at- point &optional GLOBALLY)	Enable or disable Ido ability to open URL at point with C-x C-f and other ids commands. Control behaviour in local buffer by default. Use command prefix to control it globally. This is not persistent. User option ido-use-url-at-point controls persistent setting.
Open file at point	Note that when using	g the Ido completion mode, it	e taken at point (the cursor location). They work regardless of the current input completion method. is possible to instruct Ido to use a file name at point as the basis for the file name to open. This Ido point user-option. With PEL you can control it globally or locally with <f11> f M</f11>
Set base directory for pel-open-at-point relative file names	<f11> f ;</f11>	(pel-set-open-at-point-dir)	Set the behaviour of 'pel-open-at-point' in current buffer. Which defaults to value selected by pel-open-file-at-point-dir user-option.
Superity to set a base directory to a remote host directory and open remote host files easily!		 Use visited file parent di Use buffer's current wor Use specified directory. Supports completion 	
Open file or web-page	• M- <f6></f6>	(pel-open-at-point	Open the file, library or the URL, named at point, with potential line & column #s.
whose name is at point**Command is generic and	• <f11> f . • <u>6y</u></f11>	&optional N)	 If necessary will search source code files in current project as specified by pel-filename-at-point-finders user-option. Type <f12> <f4>? to show used file search method in supporting modes.</f4></f12> Supports glob characters, partial directory path. When multiple files are found it prompts using the method selected by pel-prompt-read-method user-option.
is also specialized for: • M reStructuredText • MI - C, MI - C++			The <u>6y</u> key-chord is available if pel-use-key-chord is non-nil. See <u>S Key-Chords</u> .
• \$\overline{9}\tau - \text{Perl} • \$\overline{9}\tau - \text{Perl} • \$\overline{9}\tau - \text{UNIX Shell}	See their respective	re pages for the major mode sp	alized for some major modes, like <u>C</u> , <u>C++</u> , <u>Erlang</u> , <u>reStructuredText</u> , shell scripts. becific features. ee '=' and ':' characters are used as additional delimiters. Shell variables (such as \$HOME) are
Delimiting characters ▼	In general the command The generic mode ex	traction works by identifying th	name, and possibly line and column numbers, from text at point and tries to open the file or directory. The beginning & end of the file/directory/library/URL name string by delimiter characters, one of: tab, with a column and column numbers, from text at point and tries to open the file or directory.
File identification heuristic <f11> f <f2> r <f11> f; r</f11></f2></f11>	 If embedded space(s) are allowed in the name, point must be located at the first of the 2 delimiter chars. Otherwise point can be anywhere in the name The name may include glob characters (but not in C/C++ in #include "" or #include <> statements). The command uses a URL unchanged but uses the following heuristic to identify the exact location of the file/directory: In the file/dir name is an absolute path it uses that. Otherwise it builds a absolute path using the extracted relative path name inside the directory identified by the pel-open-file-at-point-dir user-option, which can 1) use parent directory of currently visited file, or use current working directory, 2) use current working directory, or 3) use user-specified directory. It use 		
Select multi-file	 the found file/dir name if it exists. Otherwise it searches for the relative file/dir name in directory tree under the root marker file identified by the pel-project-root-identifiers user-option which is something like _git, _hg, _project, _pel-project (the default). If it can find such a file in the above directories it searches the tree under the found root. If it finds several files it prompts using the current completion mode to allow selection of the appropriate name (see below) and opens the selected one. If it finds only one it opens that file. Otherwise, it prompts showing the name searched and provide the following choices: 1) create the file with specified name, 2) edit the name to search again, 3) use the name found and search for an Emacs library file with that name, or 4) quit. The command opens the extracted name according to this heuristic: If the string is a properly formatted URL, it opens it using the OS default browser (even if a optional numeric argument specified otherwise), otherwise if the string is a file or directory name it opens it. 		
selection method •	 If the file name is followed by line and column numbers the point is moved to that position in the buffer. When finding several file names, the command lists them and prompts using the method selected by pel-prompt-read-method user-option. The default is a very primitive function implemented by PEL. You can select a more powerful ivy prompting instead. With ivy selected, PEL will automatically set pel-use-ivy to t and lvy mode will be installed automatically when you restart Emacs. Note that the command shows all files found by the specified search method, it does not only use the first one found. 		
Select target window	 Use this to detect potential duplication in header file names in large include paths. The command opens the file in the window selected by the following logic controlled by presence or absence of typed numerical prefix arguments: Select target window: Without argument: If file or directory is already opened in a window, move point to that window and to the line column coordinates if specified. 		
N>20 : open the directory ▼	 If no window holds that file, select the target window according to the number of editable windows in frame: if 1, split that window and use the new window, if 2: use the other window, if 3 or more, use the current window. With prefix numeric argument N: N < 0: create a new window and use that. (abs N) > 20: then open the directory instead of the file. Interpret the window position from the N value adjusted: N-20 (or N+20 if N is negative) N = 0: use the 'other' (the next) window. N = 1, 3, 7or above (excluding 8, 9 and 10): select the target window based on the number of editable windows in frame: if 1 window: split that window and use the new window, if 2 windows: use the other window. if 3 or more windows: use the current window. 		
	on a numeric	lown, 4:left, 5:current, 6:right. al keyboard the location of key represent direction →	8 := up 4 := left 5 := current 6 := right 2 := down
See function docstring for more info.	(eg. macOS Fin		ociated application (with N=29 or N=-29, open the file's directory with the OS associated application is a URL, open it in the OS default web browser. dow is not allowed.
Open filename at point in a browser See also:	• <f11> f / • 6u</f11>	(pel-browse-filename-at- point)	Open the file name (or URL) at point inside the system's web browser. • If point is at dir name, open the OS app. browsing dirs (eg. macOS Finder, Windows Explorer). It is easier to type and PEL assigns its own key-chord for it.
Open URL at point in a browser See also: • <u>S Key-Chords</u> , • <u>S Web</u>	• <f11> f M-/ • 7u</f11>	(browse-url-at-point &optional ARG)	Ask a WWW browser to load the URL at or before point. • Variable 'browse-url-browser-function' says which browser to use. • With prefix argument inverts the value of the option 'browse-url-new-window-flag'. • Use <f11> <f2> E u to open the browse-url group that contains relevant user options.</f2></f11>
Copy URL at point in temporary file and visit the file	<f11> f M-u</f11>	(pel-open-url-at-point)	Copy the URL at point to a local temporary file and visit that file. • A The download copy of the file does not have the same name and may not open with the proper mode because it won't have an extension. The HTML formatted files will be recognized by Emacs but most of the files won't be. • Save the file somewhere else using the C-x C-w key sequence and identify the proper extension to activate the required major mode.
With goto-address-mode	C-c C-f		description of the URL and the goto-address-mode minor mode is active. Use <f11> f u or <f11> f U to activate this mode.</f11></f11>

	dired commands. Thi	JVV.		
		s set to ffap-bindings, then PEL	_ also activates the standard ffap bindings which take over the behaviour of the main file finding and are no longer available for these commands.	
Find file/URL at point		set to t then the standard ffap		
	<f11> f a p</f11>	(ffap &optional FILENAME)	Find FILENAME, guessing a default from text around point. • If 'ffap-url-regexp' is not nil, the FILENAME may also be an URL. Web URL opens in browser.	
			 With a prefix, this command behaves exactly like 'ffap-file-finder'. If 'ffap-require-prefix' is set, the prefix meaning is reversed. 	
			 See also the variables 'ffap-dired-wildcards', 'ffap-newfile-prompt', 'ffap-url-unwrap-local', 'ffap-url-unwrap-remote', and the functions ffap-file-at-point' and 'ffap-url-at-point'. 	
Find file/URL at point - read only	<f11> f a P</f11>	(ffap-read-only)	Like 'ffap', but mark buffer as read-only.	
	<f11> f a v</f11>	(ffap-alternate-file)	Like 'ffap' and 'find-alternate-file': kills current buffer and open new file in the same window.	
Find file/URL in other window	<f11> f a w</f11>	(ffap-other-window)	Like 'ffap', but put buffer in another window.	
	<f11> f a f</f11>	(ffap-other-frame)	Like 'ffap', but put buffer in another frame.	
	<f11> f a W</f11>	(ffap-read-only-other- window)	Like 'ffap', but put buffer in another window and mark as read-only.	
Find file/URL in other frame - read only	<f11> f a F</f11>	(ffap-read-only-other-frame)	Like 'ffap', but put buffer in another frame and mark as read-only.	
	<f11> f a d</f11>	(dired-at-point &optional FILENAME)	Start Dired, defaulting to file at point. See 'ffap'.	
	<f11> f a D</f11>	(ffap-dired-other-window)	Like 'dired-at-point', but put buffer in another window.	
	<f11> f a M-d</f11>	(ffap-dired-other-frame)	Like 'dired-at-point', but put buffer in another frame.	
	<f11> f a l</f11>	(ffap-list-directory)	Like 'dired-at-point' and 'list-directory'.	
Open a menu of all files,	<f11> f a m</f11>	(ffap-menu &optional	Put up a menu of files and URLs mentioned in this buffer. Set mark, jump to choice, and try to fetch	
URL in current buffer.		RESCAN)	it. The menu is cached in 'ffap-menu-alist', and rebuilt by 'ffap-menu-rescan'.With prefix argument: forces a rebuild. Searches with 'ffap-menu-regexp'.	
			PEL ensures that Emacs remembers the list of recently opened files and provides: es which function use used to open the recently opened files:	
• ∑ Completion/Input	ido-recentf-open	: uses the current Ido prompt	t or Ido enhanced mechanism. Use <f11> M-c ? to list them and see which one is active.</f11>	
		f: uses a popup menu	Requires counsel external package descrivated by pel-use-counsel	
	• The menu bar include <f11> f M-r M-r</f11>	s a File->Open Recent menu (pel-find-recent-file)	entry. Some other functions are activated by their respective user options. Open the recent file prompt using the currently active function.	
files, using active method	<111> 1 M-1 M-1	,	pel-initial-recent-f-function. Change with pel-select-recentf-function, bound to <f11> f M-r M-R.</f11>	
ou		 Ido completion is selecta 	be <tab> to get possible expansions listed in a separate buffer. ble. Use <f11> M-c ? to list them and see which one is active. ed, you can type C-c C-o to copy the list of files inside a special buffer.</f11></tab>	
function used to prompt	<f11> f M-r M-?</f11>	(pel-show-recentf-function &optional AFTER-	Display what function is used to visit recently opened files. • The argument is for internal use, it is not available interactively.	
for recently opened file	<f11> f M-r M-R</f11>	SELECTION-P) (pel-select-recentf-	Select the function to visit recently opened files. Modifies what is used in the current editing session,	
Select the function used to list/prompt the recently opened files.	CIIIZ I M-I M-K	function & optional RECENTF-FUNCTION SILENT)	not the persistent value selected by the pel-initial-recent-f-function user-option. The arguments are for internal use, they are not available interactively.	
Edit list of recently opened files	<f11> f M-r M-e</f11>	(recentf-edit-list)	Show a dialog to delete selected files from the recent list. • Use this to remove some of the files from the list.	
Open a recently opened file searched by fzf	<f11> f M-r M-z</f11>	(fzf-recentf &optional WITH-PREVIEW)	Open a recently opened file selected by fzf search. With C-u show file preview. See <u>fzf below.</u> Requires the <u>fzf.el</u> external package Activated by pel-use-fzf.	
Open in read-only	The following command	s open files in read-only mode.	. While in read-only mode, use Use C-x C-q to permit editing.	
	C-x C-r	(find-file-read-only	Edit file FILENAME but don't allow changes.	
<u>mode</u>		FILENAME & optional WILDCARDS) • (ido-find-file-read-only)	Like C-x C-f , but marks buffer as read-only. Use C-x C-q to permit editing.	
	• C-x 4 r	(find-file-read-only- other-window FILENAME	(find-file-read-only-other-window FILENAME & optional WILDCARDS)	
window in read-only mode	• <f11> f 0</f11>	&optional WILDCARDS) • (ido-find-file-read-only-other-window)	Edit file FILENAME in another window but don't allow changes. Like C-x C-f , but marks buffer as read-only. Use C-x C-q to permit editing.	
Opon do root	On Unix/Linux/macOS s	some files are write protected a	und can only be opened with root privilege with su or sudo. Use the following command for those. -x C-f /sudo::/path/to/file, as su with: C-x C-f /su::/path/to/file	
	<f11> f R</f11>	(pel-edit-as-root &optional ARG)	Open a file as root with sudo. Prompt for password if necessary. • If already visiting a file and a prefix ARG is specified then edit currently visited file as root.	
	Open a file with no enco	<i>'</i>	I in the Fundamental mode: the major mode normally associated with the file type is not used.	
open Enterding	Note that when using	Ido completion, it is possible t	to use a command during completion to force Ido to open the file literally. However, if you are using he only way to open a file literally.	
no encoding support	<f11> f M-1</f11>	(find-file-literally FILENAME)	Visit file FILENAME with no conversion of any kind.	
	 Format conversion and character code conversion are both disabled, and multibyte characters are disabled in the resulting buffer. The major mode used is Fundamental mode regardless of the file name, and local variable specifications in the file are ignored. Automatic uncompression and adding a newline at the end of the file due to 'require-final-newline' is also disabled. 			
	If Emacs already has	a buffer which is visiting the file	e, this command asks you whether to visit it literally instead.	
open amary			ands to convert current buffer to hexadecimal editing, like nhexl (described in <u>F Buffers</u>).	
Open a file in hexl-mode See also: Buffers	<f11> f M-x</f11>	(hexl-find-file FILENAME)	Edit file FILENAME as a binary file in hex dump format, using the 'hexl-mode'. • Switch to a buffer visiting file FILENAME, creating one if none exists.	

<u>Operation</u>	<u>Keystroke</u>	Function	<u>Note</u>
Fuzzy File Finders See fzf manual, fzf search syntax.	install and configure the <u>fzf.el</u> extends and configure	the fzf command line utility, ternal package	der that can be used within Emacs via the fzf.el emacs front-end. To use it inside Emacs, you must: and use one of the following package to use the corresponding commands: tivated by pel-use-fzf . The fzf commands below are available when this is active. iivated by pel-use-counsel . The counsel commands below are available when this is active.
Open file searched by fzf in current directory	• <f11> M-z M-z • <f11> f z</f11></f11>	(fzf &optional <u>WITH-</u> <u>PREVIEW</u>)	Open a file selected by fzf session in the current directory. Type partial file name, use fzf filter expressions. Select one file and hit return to open it inside current window. Process current working directory or Projectile process root directory if available.
fzf & fzf-directory support fzf file preview	For fzf and fzf-directory: With optional prefix (eg. C-u) the currently selected file content or attribute is shown using the preview command identified by the significant for first farmer or first farmer for first farmer		
Open file searched by fzf in specified directory	• <f11> M-z M-d • <f11> f d</f11></f11>	(fzf-directory &optional WITH-PREVIEW)	Prompt for a directory to perform the fzf file search, then open selected file inside current window. Directory prompt uses current completion mode. See Economics Completion/Input .
Open fzf searched file in current or specified directory using ivy I/F	<f11> f c</f11>	(counsel-fzf &optional INITIAL-INPUT INITIAL- DIRECTORY FZF-PROMPT)	Open a file selected by ivy-style prompt using a fzf shell command. • With C-u prefix argument first prompts for the directory to perform the fzf search. • Much slower than (fzf) for large directories because counsel captures fzf output before showing it.
Switch buffer with fzf See also: <u>Buffers</u>	<f11> b z</f11>	(fzf-switch-buffer)	Switch buffer in current window by selecting it with fzf. • Uses the fzf command line utility for fast & flexible search. • Requires the fzf.el external package activated by pel-use-fzf.
Search/open Git repo member files with fzf	<f11> f g</f11>	(fzf-git-files)	Search files committed current Git repository with fzf and open user selected file.
Search/open committed file in Git repo directory tree with fzf	<f11> f G</f11>	(fzf-git)	Search all files in current Git repository with fzf and open user selected file.
Search/open committed file in Mercurial repo tree with fzf	<f11> f h</f11>	(fzf-hg-files)	Search files committed current Mercurial repository with fzf and open user selected file.
Search/open file in Mercurial repo directory tree with fzf	<f11> f H</f11>	(fzf-hg)	Search all files in current Mercurial repository with fzf and open user selected file.
Search/open file in current projectile project with fzf. See XX Projectile	<f11> f <f8></f8></f11>	(fzf-projectile &optional WITH-PREVIEW)	Search all files in current projectile project with fzf and open selected file. With C-u show file preview. Projectile external package activated by pel-use-fzf Requires the projectile external package activated by pel-use-projectile
Grep search files with fzf for specified regex	<f11> g s</f11>	(fzf-grep)	Prompt for string to search and file grep selection expression, show grep results in a fzf session, select appropriate line to open the specific file at appropriate line.
Grep search files with fzf for specified regex in specified directory	<f11> g S</f11>	(fzf-grep-in-dir)	Prompt for directory, then for string to search and file grep selection expression, show grep results in a fzf session, select appropriate line to open the specific file at appropriate line.
Grep search Git repo member files with fzf for specified regex	<f11> g G</f11>	(fzf-git-grep)	Prompt for string to search and file grep selection expression, show grep results over current Git repo searched in a fzf session, select appropriate line to open the specific file at appropriate line. Limit This command does not seem to work properly, it searches but does not always open the file.
Open <u>Dired</u> (Directory Editor) See also: <u>Dired</u>	directory path to C-x • Prompt input comple	Z-f then Dired-mode is used. tion can be changed for these.	
a			n file tree browsers, like NeoTree and ztree (see below), or with Speedbar.
Open a directory editor	• C-x d • %-D	(dired DIRNAME &optional SWITCHES) (ido-dired)	Opens a Dired-mode buffer on the specified directory. Prompt for the directory name. PEL activates ido when the pel-use-ido-mode user option is set to t .
Run Dired in other window	C-x 4 d	(dired-other-window)	Opens a Dired-mode buffer on the specified directory inside another window. • Prompt for the directory name.
List Directory	C-x C-d	(list-directory DIRNAME &optional VERBOSE)	Display a list of files in or matching DIRNAME, a la 'ls'. • DIRNAME is globbed by the shell if necessary. • Prefix arg (C-u) means supply -l switch to 'ls'.
Jump to file entry in dired buffer ★★ Leaves point on the file jumped to, allowing immediate Dired action, eg.: C-x C-j R renames the file.	C-x C-j	(dired-jump &optional OTHER-WINDOW FILE- NAME)	Jump to Dired buffer corresponding to current buffer. If in a file, Dired the current directory and move to file's line. If in Dired already, pop up a level and goto old directory's line. In case the proper Dired file line cannot be found, refresh the dired buffer and try again. When OTHER-WINDOW is non-nil, jump to Dired buffer in other window. When FILE-NAME is non-nil, jump to its line in Dired. Interactively with prefix argument, read FILE-NAME.
Activating URLs to browse and open files	Emacs provides the goto-url-mode and the goto-url-prog-mode that turn URLs found in the current buffer into clickable buttons. Once the mode is active the following key sequences are available wheel point is over a URL button: C-c RET or the mouse to click on the <u>button</u> . If the URL is an email address a buffer to write an email to that address opens. If the URL is a web or FTP address the system browser is invoked to open the address. C-c C-n: move point to the end of the next URL in the buffer. C-c C-f: download the file identified by the URL into a local temporary file and visit the file. See (pel-open-url-at-point) above.		
Toggle goto-address- mode	<f11> f u</f11>	(goto-address-mode &optional ARG)	Minor mode to buttonize URLs and e-mail addresses in the current buffer. With a prefix argument ARG, enable the mode if ARG is positive, and disable it otherwise.
Toggle goto-address- prog-mode	<f11> f U</f11>	(goto-address-prog-mode &optional ARG)	Like 'goto-address-mode', but only for comments and strings.
Open the URL (email or web page)	C-c RET	(goto-address-at-point &optional EVENT)	Open the URL at point. If URL is a web page: open it in a browser. • If URL is a mail address: Send mail to address at, around point or before.
Move to end of next URL in buffer See also: Navigation	C-c C-n <f6> C-n</f6>	(pel-goto-next-url)	Move point forward to the end of the next URL located in the current buffer. • The global <f6> C-n key binding activates the goto-address-mode if it is not already active.</f6>
Move to beginning of previous URL in buffer	C-c C-p <f11> C-p</f11>	(pel-goto-previous-url)	Move point backward to the beginning of the previous URL located in the current buffer. • The global <f6> C-p key binding activates the goto-address-mode if it is not already active.</f6>
Insert text of	_	ds can be used to insert text from	om other files at point in the current buffer.
Insert file at point	• C-x i	(insert-file FILENAME)	Insert contents of file FILENAME into buffer after point.
Insert file literally at	• <f11> f i <f11> f I</f11></f11>	(ido-insert-file) (insert-file-literally	Set mark after the inserted text. Insert contents of file FILENAME into buffer after point with no conversion.
point		FILENAME)	Set mark after the inserted text.

<u>Operation</u>	<u>Keystroke</u>	Function	<u>Note</u>		
Write text into specified file	The following command	ls can be used to write text se	elected from current buffer into specified file.		
Write region text to file	<f11> f w</f11>	(write-region START END FILENAME &optional APPEND VISIT LOCKNAME MUSTBENEW)	Write current region into specified file. • Prompts for the specified file.		
Append region text to file	<f11> f W</f11>	(append-to-file START END FILENAME)	Append the contents of the region to the end of file FILENAME. • Prompts for the specified file.		
Set file mode	<f11> f m</f11>	(set-file-modes FILENAME MODE)	Set mode bits of file named FILENAME to MODE (an integer). Only the 12 low bits of MODE are used. Prompts for file name and then for chmod-like file mode value.		
Reverting Files	If you want to use Envariable to a list of regularity	If the file's content changed on the disk and you want to refresh the Emacs buffer visiting that file, you need to "revert" the file. If you want to use Emacs to monitor the content of a file that is continuously modified by an external process (like a log file) set the <i>revert-without-query</i> variable to a list of regular expressions describing the field it'll apply to. You can also activate the auto-revert mode for the current buffer or globally and restart its timer.			
Revert a buffer	• <f11> f r f</f11>	(revert-buffer &optional	Replace current buffer text with the text of the visited file on disk.		
See also: <u>Diff & Merge</u>	• %-u	IGNORE-AUTO NOCONFIRM PRESERVE- MODES)	 This undoes all changes since the file was visited or saved. With a prefix argument, offer to revert from latest auto-save file, if that is more recent than the visited file. This is also the command to use to reload a file that was modified on the file system. You can use ediff-current-file to see the difference between the buffer and its disk file. PEL binding for this is <f11> e b f.</f11> 		
Toggle auto-revert mode	<f11> f r a</f11>	(auto-revert-mode &optional ARG)	Toggle reverting buffer when the file changes (Auto-Revert Mode). With a prefix argument ARG, enable Auto-Revert Mode if ARG is positive, and disable it otherwise. • Auto-Revert Mode is a minor mode that affects only the current buffer. When enabled, it reverts the buffer when the file on disk changes. • When a buffer is reverted, a message is generated. This can be suppressed by setting 'auto-revert-verbose' to nil.		
Toggle auto-revert tail mode See also: ∑ Scrolling	• <f11> t • <f11> f r t</f11></f11>	(auto-revert-tail-mode &optional ARG)	 Toggle reverting tail of buffer when the file grows. With a prefix argument ARG, enable Auto-Revert Tail Mode if ARG is positive, and disable it otherwise. When Auto-Revert Tail Mode is enabled, the tail of the file is constantly followed, as with the shell command 'tail -f'. This means that whenever the file grows on disk (presumably because some background process is appending to it from time to time), this is reflected in the current buffer. You can edit the buffer and turn this mode off and on again as you please. But make sure the background process has stopped writing before you save the file! 		
Cancel/restart auto- revert timer	<f11> f r SPC</f11>	(pel-auto-revert-set-timer)	Restart or cancel the timer used by Auto-Revert Mode. If such a timer is active, cancel it.		
revert unier	 Start a new timer if Global Auto-Revert Mode is active or if Auto-Revert Mode is active in some buffer. Restarting the timer ensures that Auto-Revert Mode will use an up-to-date value of 'auto-revert-interval' (which is normally 5 seconds by default). : pel-auto-revert-set-timer is a thin wrapper over auto-revert-set-timer that displays a warning if executed when the buffer is not already in auto-revert-mode. It also displays the value of auto-revert-interval when auto-revert-set-timer is executed. 				
Saving Files	PEL supports the foll		buffer to a filesystem file. file save. Each of these actions are activated via an action-specific PEL user-option, and can in the current buffer. The actions and their associated user-option and command are listed here:		
To rename a file use one of: C-x C-j R C-x C-w	Action Delete trailing space override it for som Update time stamp o Update copyright not	and lines on save pel-delet e major modes: pel-moden n save pel-upda	ng user-option Overriding command e-trailing-whitespace des-preventing-delete-trailing-whitespace te-time-stamp pel-toggle-update-time-stamp-on-save pel-toggle-update-copyright verting command Key Sequence <f11> M-W <f11> M-T </f11></f11>		
Save file to disk	• C-x C-s • %-s	(save-buffer &optional ARG)	Save current buffer to associated file. By default, it makes the previous version into a backup file if previously requested or if this is the first save. • With C-u: marks this version to become a backup when the next save is done • With C-u C-u: makes the previous version into a backup file • With C-u C-u: marks this version to become a backup when the next save is done, and makes the previous version into a backup file. • With prefix 0: never make the previous version into a backup file. • With prefix 0: never make the previous version into a backup file. • On macOS in graphics mode only: #-s brings a OS file-save dialog. A Save and activated on-file-save actions only occur when the buffer is in "changed" status. Use M to flip that status to force an action when it has just been activated.		
Save all/some files	C-x s	(save-some-buffers &optional ARG PRED)	Prompt for files that are modified. Options: • y : save • n : don't save • C-r : look at the buffer in question • d : view differences with diff-buffer-with-file		
Write buffer to specified file Save As/Rename	C-x C-w	(write-file FILENAME &optional CONFIRM) (ido-write-file)	Similar to "Save-As": prompt for the filename. • Can also be yanked in the mini buffer, use M-n to edit it.		
Changed current buffer changed state	M-~	(not-modified &optional ARG)	With C-u profix ARG, mark buffer as modified so C-x. C-s will save		
	Z£11> W ^	,	With C-u prefix ARG, mark buffer as modified, so C-x C-s will save. Toggle copyright undate on file save and display current state.		
Toggle copyright update on save	<f11> M-@</f11>	(pel-toggle-update- copyright-on-save &optional GLOBALLY)	 Toggle copyright update on file save and display current state. By default change behaviour for local buffer only. When GLOBALLY argument is non-nil, using any prefix argument, change it for all buffers for the current Emacs editing session (the change does not persist across Emacs sessions). To modify the global state permanently modify the customized value of the 'pel-update-copyright' user option via the 'pel-pkg-for-filemng' group customize buffer with <f11> f <f2> 1.</f2></f11> ☑ This command is only available when the pel-update-copyright is set to t. 		
Toggle timestamp update on save	<f11> M-T</f11>	(pel-toggle-update-time- stamp-on-save &optional GLOBALLY)	Toggle time-stamp update on file save and display current state. • By default change behaviour for local buffer only. • When GLOBALLY argument is non-nil, using any prefix argument, change it for all buffers for the current Emacs editing session (the change does not persist across Emacs sessions). • To modify the global state permanently modify the customized value of the 'pel-update-time-stamp' user option via the 'pel-pkg-for-filemng' group customize buffer with <f11> f <f2> 1. ☐ This command is only available when the pel-update-time-stamp is set to t.</f2></f11>		
Toggle delete trailing space on save	• <f11> M-W • <f11> t w M-W</f11></f11>	(pel-toggle-delete-trailing- space-on-save &optional	Toggle deletion of trailing spaces on file save and display current state. • By default change behaviour for local buffer only.		
See also: Whitespace	- TIIC U M M-W	GLOBALLY)	 When GLOBALLY argument is non-nil, using any prefix argument, change it for all buffers for the current Emacs editing session (the change does not persist across Emacs sessions). Trailing whitespace deletion is automatically activated on file save when the pel-delete-trailing-whitespace user-option is set to t. Use this command to de-activate it or re-activate it. To modify the global state permanently modify the customized value of the 'pel-delete-trailing-whitespace' user option via the 'pel-pkg-for-filemng' group customize buffer with <f11> f <f2> 1.</f2></f11> 		

Operation	<u>Keystroke</u>	Function	<u>Note</u>
Inserting & Automatically Updating Copyrights	The copyright notice code: (add-hook To be automatically	can be automatically updated I before-save-hook 'copy'	must be placed within an area at the beginning of the file specified by the value of the copyright-limit
Insert copyright notice at point	<f11> i C</f11>	(copyright &optional STR ARG)	Insert a copyright by \$ORGANIZATION notice at cursor. → See also: Inserting Text If the ORGANIZATION environment variable is not available, Emacs prompts for it.
Update file's copyright notice	M-x copyright- update	(copyright-update &optional ARG INTERACTIVEP)	Update copyright notice to indicate the current year. • With prefix ARG, replace the years in the notice rather than adding the current year after them. If necessary, and 'copyright-current-gpl-version' is set, any copying permissions following the copyright are updated as well.
	d If you want to be pro		tives not warn if there is no copyright in the current buffer to update. It does not create a missing notice. The an existing but out-of-date copyright notice, write the following inside your init.el file: The update)
Automatic File Time Stamp on file save	Emacs has a built-in <u>automatic time-stamping of files.</u> It must be activated by adding the <u>time-stamp</u> function to the <u>before-save-hook</u> variable. This can either be done via Emacs customization system or explicitly inside your init file with the following code: (add-hook 'before-save-hook 'time-stamp) • The time stamp will be added to files that contain, inside their first 8 lines, a line that looks like one of the following:		
References: • TimeStamps @ EmacsWiki • Change time stamp format in: • markdown file • reStucturedText file	 Time-stamp: Time-stamp: " " You can, however change these defaults and get Emacs to update all sorts of time stamp formats, even inside source code statements: Emacs controls automatic insertion of timestamp with the following variables: time-stamp-pattern consists of 4 parts, each one controlled by a variable: time-stamp-line-limit: identifies where in the file the time stamp can be located. Defaults to 8: the first 8 lines. time-stamp-start: identifies the text pattern that precedes the time stamp. time-stamp-end: identifies the end of the time stamp. 		
See also: Inserting Text	 time-stamp-format specifies the format of the time stamp. Something like "%:y-%02m-%02d %02H:%02M:%02S %u" to specify the date and time in ISO format, with the user login's name. time-stamp-time-zone specifies the time zone selection: nil: Emacs local time, t: Universal time, wall: system wall clock time, TZ: controlled by a TZ environment variable The time-stamp-format and time-stamp-time-zone variables can be set in your init file or via the Emacs customization system. They are defined in the time-stamp customization group. To change the format or the pattern preceding or after the automatically updated time stamp, it is best to use file local variables: this will allow automatic time stamp updates in files with various formats. As an example, see the top and end of the PEL manual raw format file. By default, the time-stamp string must be placed within the first 8 lines of the file, otherwise it will not be updated automatically. If you want it located somewhere else in your file set the time-stamp-line-limit file local variable. PEL provides the extra user-option to control the automatic generation of time-stamps: pel-update-time-stamp user-option controls whether time-stamps are automatically update time stamps in all files where a valid time-stamp corresponding to Emacs settings as described above. Set it to t (the default) to allow automatic time stamp updates. Set it to nil to prevent them. You can also toggle it globally for the current editing session by using the <f11> f M-t key sequence.</f11> 		
Update file time stamp		g Text table for the appropriat (time-stamp)	kage provides a set of text insert commands which include inserting a time stamp. te commands. Force update the time stamp string(s) in the current buffer. • Updates a time stamp of format recognized by Emacs current settings even when automatic time-stamp update is off.
Toggle time stamp	<f11> f M-t</f11>	(time-stamp-toggle-active	 More information about the "Emacs current settings" in the description block above. Toggle 'time-stamp-active', setting whether <f11> f t updates a buffer.</f11>

Directory Tree Browsers	Emacs supports several mechanisms to browse file directories. This includes: • Emacs built-in <u>S Dired</u> directory editor, along with several extensions. You can have several different Dired buffers in an Emacs session. • The Emacs built-in <u>S Speedbar</u> and its extensions. There can only be one instance of a Speedbar buffer and that can be inside another frame. • Several other external packages: <u>dir-treeview</u> , <u>Neotree</u> , <u>treemacs</u> , <u>lsp-treemacs</u> and <u>Ztree</u> • Use <f11> B <f2> 1 to access their PEL customization and <f11> B <f3> to access the customization of these packages.</f3></f11></f2></f11>		
<u>dir-treeview</u>	The dir-treeview ex	ternal package provide a simpl	e to use expandable directory tree view in a buffer. to t. Access its configuration via <f11> B <f3> 1</f3></f11>
Browse home (or default) directory tree	<f11> B D</f11>	(dir-treeview)	Display the default directory tree inside the current (or new) <i>Dir Treeview</i> buffer. • Open the directory identified by the dir-treeview-default-root user-option which defaults to the home directory.
Browse selected directory tree	<f11> B d</f11>	(dir-treeview-open &optional DIR)	Prompt for directory, then display its directory tree inside the current (or new) <i>Dir Treeview</i> buffer. • The pro pomp proposes the dir-treeview-default-root user-option which defaults to the home directory.
View Directory Tree with NeoTree	 The NeoTree external package provides a Vim-NerdTree like tree-view of a directory with expansion/collapse. PEL activates it when pel-use-neotree is set to t. <f11> B N <f2> opens the PEL customization group to set pel-use-neotree.</f2></f11> <f11> B N <f3> prompts, select neotree to open the neotree customization group.</f3></f11> There is only one NeoTree window. It is a dedicated window. Icons used in the tree can be changed: In text mode set pel-neotree-font-in-terminal to arrows to use arrows instead of '+'. In graphics mode, if pel-neotree-font-in-graphics is set to icons then the icons provided by all-the-icons package is used. ⚠ However, once PEL has installed the package it does not install the fonts. Run grep via find	• <f11> f f g • <f11> g f</f11></f11>	(find-grep COMMAND- ARGS)	Run grep via find, with user-specified args COMMAND-ARGS. • Collect output in a buffer.		
See also: X Grep	, y .	,	• While find runs asynchronously, you can use the C-x command to find the text that grep hits refer to.		
			This command uses a special history list for its arguments, so you can easily repeat a find		
Search for files with	Z£115 £ C :	(find-dired DIP APCO)	Prompts for the root to search from and a find command to search for files with the Univ find		
find' and open Dired	<f11> f f d</f11>	(find-dired DIR ARGS)	Prompts for the root to search from, and a find command to search for files with the Unix find. • Specify the arguments for the <u>find command</u> .		
buffer			 For example, to perform a case insensitive search for all .h files, use: -iname "*\.h" Opens a Dired-mode buffer and show the files found in there. 		
Search directory for	<f11> f f n</f11>	(find-name-dired DIR	Search DIR recursively for files matching the globbing pattern PATTERN, and run Dired on those file		
files and open Dired buffer for those		PATTERN)	 PATTERN is a shell wildcard (not an Emacs regexp) and need not be quoted. The default command run (after changing into DIR) is: 		
			findname 'PATTERN' -ls		
	<f11> f f h</f11>	(find-grep-dired DIR REGEXP)	Find files in DIR that contain matches for REGEXP and start Dired on output.		
Find files in a directory and open Dired output					
			The command run (after changing into DIR) is:		
			The command run (after changing into DIR) is:		
			$\label{find.} find. $$ (-type f-exec 'grep-program' 'find-grep-options' -e REGEXP {} \; \) -ls$$ $$ where the first string in the value of the variable 'find-ls-option' specifies what to use in place of "-"$		
and open Dired output			find . \(-type f -exec 'grep-program' 'find-grep-options' -e REGEXP $\{\}\$ \; \) -ls where the first string in the value of the variable 'find-ls-option' specifies what to use in place of "-as the final argument.		
	<f11> f f 1</f11>	(find-lisp-find-dired DIR REGEXP)	$\label{find.} find. \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \$		

<u>Operation</u>	<u>Keystroke</u>	Function	<u>Note</u>
Open file with alternate extension	M- <f12> M-f</f12>	(pel-open-file-alternate)	Open a file with same name but an alternate extension. • The new extension depends on the current file extension.
Supports: • \$1 - C			The list of alternate extensions is currently very limited and restricted to C and C++. If the alternate file is not found, save the file basename in the kill ring and prompt for the file name to
• <u>\$1 - C++</u>			open.
