## **Buffers**

Operation	<u>Keystroke</u>	Function	<u>Note</u>
Emacs Buffers	PEL provides the pel-pkg • pel-use-uniquify • pel-use-ascii-table	p-for-buffer customization group to c : activates <u>uniquify</u> to that buffer n : activates the <u>ascii-table</u> external	ers. This table lists the commands you can use to list and manage buffers. ontrol some aspect of Emacs buffers. The user options are: ames show the distinguishing directory after the file name, like this: fname dir package. See ** Help/Info** for the key binding.  PEL provides Hydra when pel-use-hydra or the user option is set to t.
	pel-use-nhexl-mode     pel-use-popup-switch	: activates the <a href="mailto:nhex1-mode">nhex1-mode</a> externment: activates the <a href="mailto:npopup-switcher">popup-switcher</a>	al package used to display and manipulate the content of the current buffer in hexadecimal. external package used for piping up a list of buffers. See the <b>Windows</b> table for its description.
Open this PDF file. See also: <u>National Help/Info</u>	<f11> b <f1></f1></f11>	(pel-help-pdf &optional OPEN-WEB-PAGE)	Open the <u>Name Buffers</u> local PDF. If the prefix argument (like <b>C-u</b> or <b>M</b> ) is used, then it opens the remote GitHub hosted raw PDF instead. If the <b>pel-flip-help-pdf-arg</b> useroption is set it's the other way around.
<u>S Customize</u> PEL Buffer Support	<f11> b <f2></f2></f11>	(pel-customize-pel &optional OTHER-WINDOW)	Customize PEL Buffer support: open PEL buffer support specific group.  • If OTHER-WINDOW is non-nil (use <b>C-u</b> ), display in other window.
<u>∑ Customize</u> Emacs & external package buffer support	<f11> b <f3></f3></f11>	(pel-customize-library &optional OTHER-WINDOW)	Customize Emacs and external packages related to buffer. This includes the following customize groups: Buffer-menu, ibuffer, iflipb, minibuffer, hexl, nhexl, popup-switcher. When a prefix argument (like <b>C-u</b> ) opens the buffer inside another window.  • PEL prompts for files that may not be loaded to allow you to access all customization groups.
List Buffers & Switch to Buffer	<ul> <li>buffer-menu-open is a</li> <li>psw-switch-buffer is a</li> </ul>	drop-down hiererchical menu pop-up menu.	the frame. The list-buffers and ibuffer commands use a new buffer.
Open buffer menu	• C- <f10></f10>	(buffer-menu-open)	Start key navigation of the buffer menu.
See also: <u><b>∑ Menus</b></u>	• <c-down-mouse-1></c-down-mouse-1>		<ul> <li>List buffers in a drop-down menu: lists the buffers by major-mode when several buffers of the same major-mode are opened.</li> <li>In graphics mode this can also be invoked using the &lt;<u>C-down-mouse-1&gt;</u></li> </ul>
List open buffers in popup menu	<f11> b b</f11>	(psw-switch-buffer &optional ARG)	Show buffers list menu to switch buffer in a popup window menu.  • If ARG show only buffers with files and without * in the beginning/end of buffer name.  • Requires popup-switcher 2 PEL activates when pel-use-popup-switcher is t.
List all buffers	С-ж С-в	(list-buffers & optional ARG)     (ibuffer & optional OTHER-WINDOW-P NAME     QUALIFIERS NOSELECT     SHRINK FILTER-GROUPS     FORMATS)	Display a list of existing buffers in a buffer named "*Buffer List*", the buffer displays information about all buffers and enters the <i>Buffer Menu Mode</i> . See the keystrokes for the Buffer Menu Mode below.  The PEL package uses the 'ibuffer' function instead, which provides more functionality, working like dired, allowing to sort by name, size, mode, filtering by mode (hit return on the mode of a buffer). Type <f1> m to get the list of possible actions that can be done on the listed buffers.</f1>
Switch to buffer	С-х ь	(switch-to-buffer BUFFER-OR-	Switch window to display the previous, or another buffer (entered at echo area prompt).
See also: <u>See Completion/</u> Input		NAME & optional NORECORD FORCE-SAME-WINDOW)	To show what is currently used, type: <f11> M-c ?  To change the main completion mode, type: <f11> M-c <f4>  ■ Completion/Input for more information.</f4></f11></f11>
Navigate through Buffers in current window	PEL provides the pel-∑buffer Hydra the gives quick access to commands that changes the buffer shown in the current window.  • To gain access to the keys, type <f7> <f9> key sequence to start the pel-∑buffer Hydra.  • Then type the keys listed in the Hydra table below. Stop the Hydra with <f7>  ■Requires the hydra external package PEL provides Hydra when pel-use-hydra or the pel-use-iflipb user option is set to t.</f7></f9></f7>		
Activate the pel-∑buffer Hydra	<f7> <f9></f9></f7>	M-n: next   M: ne M-p: prev   M-,: pr M-1: last   M-v: view	Selection   Flip   Other
See <u><b>Windows</b></u>	Other keys can be typed when the pel-∑buffer Hydra is active. The Hydra menu shows at the bottom of the frame. Type? to toggle displaying You may wan to switch to the pel-∑wnd Hydra to change and manage window(s) by typing <f7> <f7> followed by a cursor key.</f7></f7>		The Hydra menu shows at the bottom of the frame. Type ? to toggle displaying it.
Next/Previous     Buffer	The following commands change current buffer to next or previous buffer, or to what was used last.  The commands are accessible through the pel-∑buffer Hydra when the <a href="hydra">hydra</a> package is used. They are also always available from global key sequences.		
Switch to next buffer	• C-x <right> • C-x C-<right> • <f11> b n  * <f7> <f9> M-n</f9></f7></f11></right></right>	(next-buffer)	Switch to the next buffer displayed in the current window.
Switch to previous buffer	• C-x <left> • C-x C-<left> • <f11> b p  * <f7> <f9> M-p</f9></f7></f11></left></left>	(previous-buffer)	Switch to the previous buffer displayed in the current window.  • This command is also available in the pel-∑buffer Hydra as M-p
Switch to previous buffer in window	<f11> b 1 * <f7> <f9> M-1</f9></f7></f11>	(pel-switch-to-last-used – buffer)	Switch buffer in current window to the buffer previously seen in this window. Used twice returns to the same buffer.
Flip to next/ previous recently visited buffer	The following commands let you flip between recently visited buffers in a way that resembles what Alt-Tab and Alt-Shift-Tab does on Windows.  • A list of buffers is shown in the minibuffer at the bottom of the screen when you use the command. You can see them in the pel-∑buffer Hydra above.  • You can also identify buffer filtering in the iflipb customization group (use <f11> b <f3> and select iflipb to access it).  □ This requires the iflipb external package □ PEL activates it when pel-use-iflipb user-option is turned on (set to t). This also forces activation of the hydra package because the iflipb commands are bound to the pel-∑buffer Hydra. allowing quick single keystroke access without the use of a prefix key.</f3></f11>		
Flip to next buffer	* <f7> <f9> <f9></f9></f9></f7>	(iflipb-next-buffer ARG)	Flip to the next buffer in the buffer list.  Consecutive invocations switch to less recent buffers in the buffer list.  Buffers matching 'iflipb-always-ignore-buffers' are always ignored.  Without a prefix argument, buffers matching 'iflipb-ignore-buffers' are also ignored.
		(iflipb-previous-buffer)	Flip to the previous buffer in the buffer list.
Flip to previous buffer	* <f7> <f9> <s-f9></s-f9></f9></f7>	(IIIIpb-previous-buller)	Consecutive invocations switch to more recent buffers in the buffer list.

<u>Operation</u>	<u>Keystroke</u>	Function	<u>Note</u>
Buffer Selection			hrough the pel-∑buffer Hydra when the <b>hydra</b> package is used. ides extra commands that extends it.
Show next buffer in selection	* <f7> <f9> M</f9></f7>	(pel-bs-next)	Show next buffer in current window.  Next buffer is selected by the criteria selected by bs-show and bs-configuration.
Show previous buffer in selection	* <f7> <f9> M-,</f9></f7>	(pel-bs-previous)	Show previous buffer in current window.  Next buffer is selected by the criteria selected by bs-show and bs-configuration.
Customize buffer selection	• <f11> b S</f11>	(bs-customize)	Customization of group bs for Buffer Selection Menu.  • Active configuration can be changed in the bs-show buffer. See below.
Show Buffer Selection	• <f11> b s</f11>	(bs-show ARG)	Open the <b>bs-mode</b> buffer by splitting the current window  • Shows menu of buffers to select and manipulate buffers.  • See bs-mode commands below.
Buffer Selection Menu (bs-mode) commands	<ul> <li>There are many key commands similar to 'Buffer-menu-mode' for manipulating the buffer list and the buffers themselves. User can move with [up] or [down], select a buffer by RET or [SPC]</li> <li>Type q to leave Buffer Selection Menu without a selection.</li> <li>Type ? after invocation to get help on commands available.</li> <li>With prefix argument ARG show a different buffer list. Function 'bsconfiguration-name-for-prefix-arg' determine accordingly name of buffer configuration.</li> </ul>		
Select current line's buffer : visit buffer	• RET • SPC • f	(bs-select)	Select current line's buffer and other marked buffers.  If there are no marked buffers the window configuration before starting Buffer Selection Menu will be restored. If there are marked buffers each marked buffer and the current line's buffer will be selected in a window.  Leave Buffer Selection Menu.
View current line's buffer	v	(bs-view)	View current line's buffer in View mode. A minor mode for viewing text but not editing it.  • See Buffer View Mode below in this table.  • Leave Buffer Selection Menu.
Move point down	• n • <down></down>	(bs-down ARG)	Move point vertically down ARG lines in Buffer Selection Menu.
Move point up	• p • <up></up>	(bs-up ARG)	Move point vertically up ARG lines in Buffer Selection Menu.
Refresh Buffer Selection Menu	g	(bs-refresh &rest IGNORED)	Refresh whole Buffer Selection Menu.
Bury buffer	b	(bs-bury-buffer)	Bury (not kill!) the buffer on this line: move it to the end of buffer list.
Cycle through buffer line sorting method	S	(bs-show-sorted)	<ul> <li>Show buffer list sorted by next sort aspect.</li> <li>The sort methods supported are: by name, by size, by mode, by filename, by nothing (not sorted).</li> </ul>
Toggle show all buffers  Cycle through buffer	а	(bs-toggle-show-all) (bs-select-next-configuration	Toggle show all buffers / show buffers with current configuration.  Apply next configuration START-NAME and refresh buffer list.
selection configuration : types of buffers iterated through	c	&optional START-NAME)	<ul> <li>Apply flext configuration STANT-PANNE and reflext outler list.</li> <li>If START-NAME is nill the current configuration 'bs-current-configuration' will be used.</li> <li>Cycles through the following methods of buffer cycling: all, files, files-and-scratch, all-intern-last</li> </ul>
Prompt for buffer selection configuration	С	(bs-set-configuration-and-refresh)	Ask user for a configuration and apply selected configuration.  • Supports tab-based completion.  • Refresh whole Buffer Selection Menu.
Open selected buffer in other window	o	(bs-select-other-window)	The window configuration before starting Buffer Selection Menu will be restored unless there is no other window. In this case a new window will be created.  • Leave Buffer Selection Menu.
Open selected buffer in other window - stay in Buffer Selection buffer	C-0	(bs-tmp-select-other-window)	Make the other window select this line's buffer.  • The current window remains selected.
Save buffer	s	(bs-save)	Save buffer on current line.
Kill buffer Toggle buffer read-only	k %	(bs-delete) (bs-toggle-readonly)	Kill buffer on current line.  Toggle read-only status for buffer on current line.
status  Clear buffer modified-	~		Uses function 'read-only-mode'.
flag	~	(bs-clear-modified)	Set modified flag for buffer on current line to nil.  Be sure you don't want to save these modifications:  Emacs won't prompt you for that modified buffer when closing.
Visit tags table file	t	(bs-visit-tags-table)	Visit the tags table in the buffer on this line.  See 'visit-tags-table' bound to <f11> x t in PEL. See ∑Xref - Cross References.</f11>
Mark line's buffer to be displayed	m	(bs-mark-current COUNT)	Mark buffers.  COUNT is the number of buffers to mark.  Move point vertically down COUNT lines.
Mark line's buffer to show always	+	(bs-set-current-buffer-to-show- always &optional NOT-TO- SHOW-P)	Toggle status of buffer on line to 'always shown'.  NOT-TO-SHOW-P: prefix argument.  With no prefix argument the buffer on current line is marked to show always.  Otherwise it is marked to show never.
Toggle line's buffer show always/never/normal	М	(bs-toggle-current-to-show)	Toggle status of showing flag for buffer in current line through: never show, always show, show normally
Unmark previous line buffer to be displayed	DEL	(bs-unmark-previous COUNT)	Unmark previous COUNT buffers.  • Move point vertically up COUNT lines.  • When called interactively a numeric prefix argument sets COUNT.
Unmark line's buffer to be displayed	u	(bs-unmark-current COUNT)	<ul> <li>Unmark buffers.</li> <li>COUNT is the number of buffers to unmark.</li> <li>Move point vertically down COUNT lines.</li> </ul>
Unmark all buffer lines	U	(bs-unmark-all)	Unmark all buffers.
Scroll right	• > • C-x >	(scroll-right &optional ARG SET- MINIMUM)	Scroll selected window display ARG columns right.  • Default for ARG is window width minus 2.
Scroll left	• < • C-x <	(scroll-left &optional ARG SET-MINIMUM)	Scroll selected window display ARG columns left.  • Default for ARG is window width minus 2.
Close Buffer-Selection- Menu buffer	• q • C-c C-c	(bs-kill)	Let buffer disappear and reset window configuration.
Abort	• C-g • C-]	(bs-abort)	Ding and leave Buffer Selection Menu without a selection.
Display Help	?	(bs-help)	Display help in the Help buffer.  ⚠ This conflicts with PEL pel-∑buffer hint key which takes precedence.
		1	1

<u>Operation</u>	Keystroke	Function	<u>Note</u>
Manage Buffers	The following commands su	ipport buffer management: display in	formation, change read-only mode, clone buffer, rename buffer, kill buffer, etc
Show name of previous buffer in window	<f11> b ?</f11>	(pel-show-window-previous- buffer)	Show the name of previous buffer used in the current window.
Toggle read-only status of buffer	• C-x C-q • <f11> b r</f11>	(read-only-mode &optional ARG)	When the buffer is in read-only mode the mode line shows '%%' on the left side, in the 'ch' area of "cs:ch-fr buf pos line (major minor)".  The manual states: "For a read-only buffer, it shows '%*' if the buffer is modified, and '%%' otherwise."  See also: the View Mode activating commands toward the end of this table.  A buffer in View Mode cannot be modified.  The View Mode may be used to ensure that no modifications are made to a buffer (visiting a file or not).
Clone buffer	<f11> b c</f11>	(clone-buffer &optional NEWNAME DISPLAY-FLAG)	Create and return a twin copy of the current buffer.  • Unlike an indirect buffer, the new buffer can be edited independently of the old one (if it is not read-only). NEWNAME is the name of the new buffer. It may be modified by adding or incrementing <n> at the end as necessary to create a unique buffer name.  • For example if buffer *Help* is opened it opens another one named *Help*&lt;2&gt; (or *Help*&lt;3&gt; if *Help*&lt;2&gt; already exists, etc)</n>
Rename a buffer	<f11> b R</f11>	(rename-buffer NEWNAME &optional UNIQUE)	If UNIQUE argument is non-nil via C-u M-x rename-buffer, the name is auto generated to be unique.
Rename buffer - use unique name	<f11> b U</f11>	(rename-uniquely)	Rename the current buffer by adding ' <number>' to the end.  • Use this if you want multiple "Buffer" or "Info" buffers for example.  • Example: StackExchange: How can I have multiple help buffer with different content</number>
Kill current buffer See also: ∑ Windows	• <f11> b k • 第-k • 第-&amp;</f11>	(kill-current-buffer)	<ul> <li>Kill (close) the current buffer. Does not prompt if there is no change in the buffer.</li> <li>PEL also provides a window management Hydra with ability to kill the current buffer.</li> <li>See <u>Windows</u> for more info.</li> </ul>
Kill buffer	C-x k	(kill-buffer &optional BUFFER-OR-NAME)	Kill (close) the current buffer.  • Always prompt to identify a buffer, current is identified. Press enter to kill the buffer.
Kill current buffer and close window See also: Windows	• C-x 4 0 • <f7> k</f7>	(kill-buffer-and-window)	Kill the current buffer and delete the selected window.  • PEL also provides a window management Hydra with ability to kill the current buffer and close windows in separate operations. See <u>▼ Windows</u> for more info.
Kill some buffer		(kill-some-buffers &optional LIST)	Kill some buffers. Asks the user whether to kill each one of them.
Delete all windows of a specific buffer		(delete-windows-on &optional BUFFER-OR-NAME FRAME)	Deletes all windows showing BUFFER-OR-NAME, by calling 'delete-window' on those windows.
Accumulating Text	Emacs provides the following	ng commands to insert text in buffer f	rom various sources.
Append region to specified buffer	<f11> b M-a</f11>	(append-to-buffer BUFFER START END)	Append to specified BUFFER the text of the region.  The text is inserted into that buffer before its point.  BUFFER can be a buffer or the name of a buffer; this function will create BUFFER if it doesn't already exist.
Prepend region to specified buffer	<f11> b M-p</f11>	(prepend-to-buffer BUFFER START END)	Prepend to specified BUFFER the text of the region.  The text is inserted into that buffer after its point.  BUFFER can be a buffer or the name of a buffer; this function will create BUFFER if it doesn't already exist.
Copy region to specified buffer (replacing old content)	<f11> b C-c</f11>	(copy-to-buffer BUFFER START END)	Copy to specified BUFFER the text of the region.  The text is inserted into that buffer, replacing existing text there.  BUFFER can be a buffer or the name of a buffer; this function will create BUFFER if it doesn't already exist.
Insert content of specified buffer at point	<f11> b i</f11>	(insert-buffer BUFFER)	Insert after point the contents of BUFFER.  • Puts mark after the inserted text.  • BUFFER may be a buffer or a buffer name.
Append region's text to specified file	<f11> b f</f11>	(append-to-file START END FILENAME)	Append the contents of the region to the end of file FILENAME.  • This does character code conversion and applies annotations like 'write-region' does.
Indirect Buffers	As described in Emacs Indirect Buffer section, "an indirect buffer shares the text of some other buffer, called the base buffer of the indirect buffer. In some ways it is a buffer analogue of a symbolic link between files. The text of the indirect buffer is always identical to the text of its base buffer; changes made by editing either one are visible immediately in the other. But in all other respects, the indirect buffer and its base buffer are completely separate. They can have different names, different values of point, different narrowing, different markers, different major modes, and different local variables."  Use indirect buffers to show the same file in 2 or more windows but want to narrow an area in 1 buffer while seeing the complete text in the other window.		
<u>Create indirect buffer</u> <u>explicitly</u>	<f11> b I m</f11>	(make-indirect-buffer BASE- BUFFER NAME &optional CLONE)	Create and return an indirect buffer for buffer BASE-BUFFER, named NAME.  • BASE-BUFFER should be a live buffer, or the name of an existing buffer.  • NAME should be a string which is not the name of an existing buffer.  • Optional argument CLONE non-nil means preserve BASE-BUFFER's state, such as major and minor modes, in the indirect buffer.  • CLONE nil means the indirect buffer's state is reset to default values.
Create indirect buffer of current buffer	<f11> b I c</f11>	(clone-indirect-buffer NEWNAME DISPLAY-FLAG &optional NORECORD)	Create an indirect buffer that is a twin copy of the current buffer.
	called with a prefix arg, N an existing suffix. Trying  • DISPLAY-FLAG non-nil m	EWNAME defaults to the current buff to clone a buffer whose major mode eans show the new buffer with 'pop-	IEWNAME from the minibuffer when invoked with a prefix arg. If NEWNAME is nil or if not fer's name. The name is modified by adding a ' <n>' suffix to it or by incrementing the N in symbol has a non-nil 'no-clone-indirect' property results in an error. to-buffer'. This is always done when called interactively. buffer at the front of the list of recently selected ones.</n>
Create indirect buffer of current buffer in another window	• C-x 4 c • <f11> b I w</f11>	(clone-indirect-buffer-other- window NEWNAME DISPLAY- FLAG &optional NORECORD)	Like 'clone-indirect-buffer' but display in another window.

<u>Operation</u>	<u>Keystroke</u>	Function	<u>Note</u>
Buffer View Mode	Several commands (view-bu commands are available.	uffer, etc, see at top of this table) act	tivate the View Mode for a buffer where the buffer is essentially read-only and special
Toggle Buffer view- mode • In view-mode no modifications are allowed.	<f11> b v * <f7> <f9> M-v</f9></f7></f11>	(view-buffer BUFFER &optional EXIT-ACTION)	View BUFFER in View mode, returning to previous buffer when done.  • Emacs commands editing the buffer contents are not available; instead, a special set of commands (mostly letters and punctuation) are defined for moving around in the buffer.  • Space scrolls forward, Delete scrolls backward.  • Type H for a list of all View commands. See the View Mode command list below.
View Mode commands	Digits provide progrative commove to negative commove to ore scroll so scroll so zeroll so zerol		
Buffer Menu Mode	other-window, or M-x view-file-other-frame, then c, q and C will return to that buffer.  The list of buffers is shown inside its own buffer, *Buffer List* when (list-buffer) is executed. This buffer support the following commands.  ➡The full list of key bindings is available via the <f1> m key.  ➡Note that PEL uses (libuffer) for the C-x C-b key binding, so the list of commands and key bindings that are available differ. They are listed in the</f1>

IBuffer Mode Other commands	g : Regenerate the list of all buffers. Prefix arg means to toggle whether buffers that match 'ibuffer-maybe-show-predicates' should be displayed.  : Change the current display format. Use this to see the complete file name when the file name is long.  SPC : Move point to the next line.  C-p : Move point to the previous line.  h : Show this help.  = : View the differences between this buffer and its associated file.  RET : View the buffer on this line.  o : As above, but in another window.  C-o : As both above, but don't select the new window.  b : Bury (not kill!) the buffer on this line.		
Edit Binary file with hexl	use the hexl-find-file to	next mode to edit files in hexadecimal open the file in binary mode, or mand to convert an already opened	al mode. To use it you must:  buffer. To exit this mode and go back to the original mode type C-c C-c
Open a file in hexl-mode See also: <u>▼ File-mngt</u>	<f11> f M-x</f11>	(hexI-find-file FILENAME)	Edit file FILENAME as a binary file in hex dump format.  • Switch to a buffer visiting file FILENAME, creating one if none exists, and edit the file in 'hexl-mode'.
Toggle hexl mode	<f11> b M-x</f11>	(hexl-mode &optional ARG)	Toggle the hexl mode: a mode for editing binary files in hex dump format.
	<ul> <li>This is not an ordinary major mode; it alters some aspects of the current mode's behavior, but not all; also, you can exit Hexl mode and return to the previous mode using 'hexl-mode-exit'.</li> <li>This function automatically converts a buffer into the hexl format using the function 'hexlify-buffer'.</li> <li>Each line in the buffer has an "address" (displayed in hexadecimal) representing the offset into the file that the characters on this line are at and 16 characters from the file (displayed as hexadecimal values grouped every 'hexl-bits' bits, and as their ASCII values).</li> <li>If any of the characters (displayed as ASCII characters) are unprintable (control or meta characters) they will be replaced by periods.</li> </ul>		
Insert a byte in decimal	C-M-d	(hexl-insert-decimal-char ARG)	Insert a character given by its decimal code ARG times at point.
Insert a byte in octal	С-М-о	(hexl-insert-octal-char ARG)	Insert a character given by its octal code ARG times at point.
Insert a byte in hex	C-M-x	(hexl-insert-hex-char ARG)	Insert a character given by its hexadecimal code ARG times at point.
Goto 512-byte page start	С-М-а	(hexl-beginning-of-512b-page)	Go to beginning of 512 byte boundary.
Goto to 512-byte page end	С-М-е	(hexl-end-of-512b-page)	Go to end of 512 byte boundary.
Goto 1K end	C-x ]	(hexl-end-of-1k-page)	Go to end of 1KB boundary.
Goto 1K beginning	C-x [	(hexl-beginning-of-1k-page)	Go to beginning of 1KB boundary.
Goto address entered in hexadecimal	м-д	(hexl-goto-hex-address HEX- ADDRESS)	Go to Hexl mode address (hex string) HEX-ADDRESS.  • Signal error if HEX-ADDRESS is out of range.
Goto to address entered in decimal	м-ј	(hexl-goto-address ADDRESS)	Go to hexl-mode (decimal) address ADDRESS.  • Signal error if ADDRESS is out of range.
Exit hexl mode	C-c C-c	(hexl-mode-exit &optional ARG)	Exit Hexl mode, returning to previous mode.  • With arg, don't unhexlify buffer.
Hexadecimal Editing with nhexl	The <a href="mailto:nhext-mode">nhext-mode</a> external package used to display and manipulate the content of the current buffer in hexadecimal and manipulate hex dump files.  PEL downloads installs and activates this package when the <a href="mailto:pel-use-nhext">pel-use-nhext</a> user option is set to <a href="mailto:text-nhext">t.</a> • Use the <a href="mailto:sf11">sf11</a> b <a href="mailto:sf2">b</a> key sequence to open the PEL buffer customization buffer to access this user option.  Once the hexadecimal mode is on, turn it off by executing the nhexl-mode command again.  Good nhexl-mode features:  • The nhexl-mode keeps the undo history when you toggle the nhexl mode. Something that the helx mode does not do.  • You can use all of the normal navigation commands. You don't need to use specialized commands. PEL home and end commands work.		
Toggle buffer between normal and hex display	<f11> b x</f11>	(nhexl-mode &optional ARG)	Toggle minor mode to edit files via hex-dump format.  Requires the <a href="mailto:nhexl-mode">nhexl-mode</a> package <a href="mailto:nhexl-mode">nhexl-mode</a> activated when <a href="mailto:nhexl-mode">pel-use-nhexl</a> user option is <a href="mailto:nhexl-mode">t.</a>
Activate Hex nibble editing mode	<f11> b X</f11>	(nhexl-nibble-edit-mode &optional ARG)	Minor mode to edit the hex nibbles in 'nhexl-mode'.  Note: only works after nhexl-mode has been activated once.  Requires the <a href="mailto:nhexl-mode">nhexl-mode</a> package activated when <a href="mailto:pel-use-nhexl">pel-use-nhexl</a> user option is t.
