Perl scripts

Writing Perl scripts	Impose strictures in Perl files t	Impose strictures in Perl files to prevent errors by adding one of the following use lines. Also see the strictures package.			
Use the following at the beginning of Perl script files. perldiag @ perldoc	<pre>#!/usr/bin/env perl use strict; use warnings; # for testing only: use diagnostics;</pre>	#! /usr/bin/perl -w use v5.12; # loads strict use v5.35; # &loads warnings use diagnostics produces more info but increases startup time. Alternative: perl -Mdiagnostics . Emacs p	Executable Perl script should have a valid shebang line identifying the appropriate location of the Perl interpreter. It may have to be modified at installation time (OpenGroup/SUS). It's best to: use warnings; perl -w generates warning for all Perl code in the program including modules used by the program. Also use the _c option to check syntax. But most Perl code should also activate the strict Perl rules and warnings to detect warnings. See: Barewords in Perl el-perl-critic command can report diagnostic.		
use version/features	<u>use</u> v5.36;	This can be used to enable both the strict • See the table listing the feature bundle	and warning pramas as well as several <u>named features</u> . es per Perl versions.		
Perl version history • at perldoc M: minor, P: patch level	Perl Versions Guide Perl versions @ perldoc Equivalence between decimal	5.even: maintenance track version 5.odd: development track version and dot-decimal versions: AAA.MMMPP	decimal: 1.02. # old way dot-decimal: v5.38.2 vAAA.MMM.PP . Note that 3 Minor digits are used in the decimal versions. Patch use 2 or 3.

Perl 5 Operators
Perl 5 Operators
                            Perl operators, listed below with their precedence and associativity.
                                                                                                                                             C Operators missing from Perl: unary &, unary * and (type)
                   Note:
                            • Quote and Quote-like operators: in Perl quotes are operators and they provide various kind of interpolating and pattern matching capabilities
Associativity: one of:
                            left
                                         terms and list operators (leftward)
                                                                                                                                        Note: print, sort, reverse, chmod, are list operators
  right
                            1eft
                                          Arrow Operator:
  left
                            NA
                                         Auto-increment and Auto-decrement: ++ --
• NA : not associative:
                             right
                                         Exponentiation:
  cannot use more than one of these operators
                            right
                                         Symbolic Unary Operators:
                                                                                     1 ~
                                                                                            -. \ and unary + and -
                                                                                                                                        Note: The operator \ creates a reference. See example.
                            left
                                         Binding operators:
   in sequence.
                            left
                                                                                    * /
                                                                                            %
                                         Multiplicative Operators:
                                                                                                  x

    CH: chained

                            left.
                                          Additive Operators:
                            left
                                                                                           >>
                                         Shift Operators:
                                                                                     <<
                            NA
                                         named unary operators

                                                                                In scalar context localtime returns human readable time.
operators that achieve a
                                                                                                                                                     $ perl -le 'print ~~localtime'
                                                                                but in list context it returns a 9-tuple with date elements.
                                                                                                                                                        on Nov 30 09:06:13 2009
specific effect.

    Negation of a true value by "!" or "not"

Truth and falsehood
                            False in a boolean context:
                                                                                                          These scalar values are false:
                                                                                                                                                     All other scalar values are true, such as:
                                                                returns a special false value.

When evaluated as a string it is
                                                                                                             undef - the undefined value
                                                                                                                                                       1 and any non-0 number
                               • the number \mathbf{0},
1 The strings '0' and '
                               • the strings '0' and ' '.

    0 the number 0, even if you write it

                                                                                                                                                         ' the string with a space in it
mean false. The output
                                                                treated as ", but as a number, it is treated as 0.
                                                                                                                                                     • '00' two or more 0 characters in a string
                                                                                                             as 000 or 0.0
                                  the empty list ().
of glob() may return a file

"0\n" a 0 followed by a newline
'true'. 'false' . Even 'false' evaluates to true.

                                                                                                              the empty string.
                                  "undef
named '0'!
                                                                                                          • '0', a single 0 in the string.
1 The bareword false
                              All other values are true.
                                                                                                                                               use constant { true => 1, false => 0 };
has a truth value of true!
                             🤞 One way to define valid true and false constant symbols that can be used in assignments (but see 🗢):
                                                                                                                                               if (-e $fname && -f _ && -r _ ) {
  print("$fname exists, is readable\n"); }
File test operators
                            File tests can be stacked (-r -w -e $fname) or combined as in the following example or:
See filetest -X
                               Notice the underscore in the example: it's the virtual filehandle _ accessing the last stat or lstat result :
                                         is readable by effective uid/gid
                                                                                                                                                     is a block special file.
The operators check if
                                                                                       exists.
                                         is writable by effective uid/gid is executable by effective uid/gid
the file..
                                                                                       is empty
                                                                                                                                                     is a character special file.

                                                 Same as $days, use before alphanumumerics.
                                                                                                                                Multi-dimensional hash
auote:
            $Dog'days
                             $Dog::davs
                                                  The $days variable inside the Dog package.
                                                                                                                                Multi-dimensional hash emulation
list and Array
                                                                                                           • A list is an ordered collection of scalars (of any type).
                        @
                                               Array containing ($days[0], $days[1], ... #days[$#days])
  0-based indexed (first
                             @days[3,4,5] Array slices containing ($days[3], $days[4], $days[5])
                                                                                                             An array is a variable that contains a list.
  index is 0).
                             @days[3..5] Array slices containing ($days[3], $days[4], $days[5])
                                                                                                           · Reading beyond the end of array returns undef
                             · Negative indices used in read access from the end: -1 is last item
  @name is $#name
                              Use these negative indices to access from the end. Do not compute index with $#name -3, if the list size is 2, this will give invalid results.
                             • Use a slice to select multiple elements from a list, array, or hash.
                                                                                                                                                     mv @diaits = (0..9)
                                                                                                           my @extracted = (6, 2, 8, 4):
· array slices LPo
                                                                                                           my @choices = @digits[@extracted]
my $mod_time = (state $filename)[9];
                                                                                                                                                      my @one2five = @digits[1..5];
    Simple explanation
                            • Don't use a slice when you know you need exactly one element.
                                                                                                                                                     my @premiers = @digit[1, 2, 3, 5, 7];
                              An Ivalue slice imposes list context on the righthand side.
                            @extracted[1, 3] = (7, 9);
                               What are the advantages of anonymous array? @ StackOverflow
                                                                                                           • Anonymous array := a type of array reference. Use it to build nested data structures.
· Anonymous arrays

    Array reference allows Perl to treat the array as a single item.

                                                                                                                           octal also
                                                                                                                                                    Perl >= v5.34
                             floating-point if the operation done to it requires it
                             (such as dividing 1 by 2).
                                                                                       my $x = 0b1100_0010;
                                                                                                                         # binary with underlines

    string

                            • double-quoted strings: perform backslash and variable interpolation of expression that begin with $ (a scalar) or @ (an array). Hashes cannot be interpolated.
                               single-quote strings: only perform \' and \\ substitution (to ' and \ respectively), nothing else.
                              Single quote and double quote strings can spread multiple lines; it embeds the newline character on each new line.
                            • \n is only expanded in double quoted strings. In single quote string it is treated as two characters; no substitution is done (as explained above).

    Unicode support

                                                                                                          See: \underline{\mathsf{Perl}\ \mathsf{Unicode}\ \mathsf{Tutorial}}, \underline{\mathsf{Perl}\ \mathsf{Unicode}\ \mathsf{Introduction}}, \underline{\mathsf{Perl}\ \mathsf{Unicode}\ \mathsf{Support}}\ @\ \mathsf{perldoc}
                            Use Unicode literally in a program; add the utf8 pragma: use utf8;

	STDERR	standard error	0 ,	,	while STDOUT is buffered by defa shing it or assign 1 to \$ to active		RR may show up before STDOUT.
	DATA						
				4			

The for and foreach statements impose a list context; the complete list is

my \$next_step = <u>do</u> {

processed. Therefore a loop like the following trying to stop on a line that has "_END_" on it will **not** work since it reads all of STDIN:

foreach (<STDIN>) {
 last if ?__END__/;

...;

• The do block is *very useful* to set a value based on several

executed inside the block. Do "not" return from the block.

The last, next and redo cannot be used inside do blocks.

• perl -e 'print join("\n", @INC), "\n";'
• perl -le 'print for INC';'

block that may use scoped variables

conditions, just as the ?: conditional operator but with an explicit

Takes advantage of a block value is the value of the last expression

The while statement imposes a scalar context; it takes

one line at a time from <STDIN> and the following code

last if /__END__/;

You can also get more information with perl -V

while (<STDIN>) {

...;

works properly:

my (%perl_nirvana, \$emacs_nirvana) = check-nirvana-levels();
if (\$perl_nirvana < 5 && \$emacs_nirvana < 8) { 'study-Perl' }
elsif (some_other_cond()) { 'time-to-cook' }
elsif (\$emacs_nirvana < 7) { 'look-into-eieio' }
else { \$isit_winter? 'go-skiing' : 'go-canoeing' }</pre>

Perl 5 Subroutines ##

Perl subroutines subroutine & Another point of view: Subroutines and Ampersands · Why we teach the subroutine ampersand Why should I use the & to call a Perl subroutine? @ StackOverflow Subroutine Prototypes An older Perl feature. Clashes with subroutine signatures as of Perl v5.20. In Perl >= v5.20 put the :prototype attribute before subroutine prototype parenthesis. Subroutine signatures Exactly zero arguments Zero or 1 argument, no default, unnamed: (\$=) () Perl >=5.36: StablePerl >= 5.20: Zero or 1 argument, no default, named (\$val=) Zero or 1 argument, named, with default (\$val=1) Experimental Exactly 2 arguments exactly 1 named argument: (\$val) (\$v1, \$v2) See: Use v5.20 subroutine signatures (\$v1, \$v2, \$v3='a', \$=) 2. 3 or 4 arguments no defaults: (\$v1, \$v2, \$=, \$=) 2.3 or 4 arguments, 1 default: Two or more arguments, remainders into a named array: Two or more, any number of arguments. (\$v1, \$v2, @) (\$v1, \$v2, @rest) Two or more arguments: an even number (\$v1, \$v2, %) Two or more arguments, remainders into a named hash: (\$v1, \$v2, %rest) Class method (\$class, ...) Object method (\$self, ...) Returned value The result of the last evaluated expression is implicitly returned The return operator can be used but it's not required unless used to change execution flow (return immediately from the subroutine). • The subroutine can return a scalar in scalar context or a list if called in list context Inside the subroutine, use the <u>wantarray</u> function to determine the context of the subroutine call.

Perl 5 Modules

		Peri 5 Modules 200					
Perl Modules							
Perl core modules		How to detect where a module is installed : perldoc -1 Module How to check if a module is part of Perl core : corelist Module (Perl >= v5.9.2)					
Access to Modules	Provide acc	cess to modules in your code with one of the following: do, require or use					
Modules @perItutorial Modules Using simple modules ₫	<u>do</u>	Looks for the module file by searching the ②INC path. Performed at run time (and therefore can be done conditionally). • If Perl finds the file, it places the code inside the calling program and executes it. Otherwise, Perl will skip the do statement silently. • The "included" code does not have access to the lexical variables from the main program. • Skip the ②INC path lookup if given a file path starting with ./,/, or /					
reg	require	Loads the module file once, also searching the <u>@INC</u> path. Performed at run time (and therefore can be done conditionally). • If the <u>require</u> for the same file appears twice, Perl ignores it. Perl will issue an error message if it cannot find the file (as opposed to <u>do</u>). • Skip the <u>@INC</u> path lookup if given a file path starting with ./,/, or /					
The <i>normal</i> way to access Perl modules ➡	use	Similar to require except that Perl applies it before the program starts: it's done at compile time . Modify it dynamically in a BEGIN block. See IntPo . • Therefore the <u>use</u> statement cannot be invoked inside conditional statements such as if-else. Used often to include a module in a program. That imports the defaults as defined by the module's code. Select what to import with one of the two equivalent forms: (See IntPo): • <u>use</u> Module::Name ('function_a', 'function_b'); • <u>use</u> Module::Name (gw(function_a function_b); • <u>use</u> Module::Name (); # import nothing. All accesses to the module must be done with Module::Name::something					
Error handling for: Can't locate in @INC How to fix that See Also: IntPor	 Perl look if you have If Perl does Add the 	we statements to work Perl must be able to identify the location of the requested module(s). In the second inside the directories identified by the line array. Inside your code, Perl looks for a sub-directory named 'The' containing a file named 'Module.pm' inside each line directory. In the second inside your code, Perl looks for a sub-directory named 'The' containing a file named 'Module.pm' inside each line directory. Topic: Data Introspection

Data Introspection						
Using Perl Debugger	Debug a pr	rogram:	perl -d program	n_name	program_args	
Debugger Tutorial	Debug inte	eractive session:	perl -d -e 0			
Debugger commands	q	Quit debugger	+	s	single step	
	h	help. List all availa	able commands.	x	evaluate expression	
Modules for Data introspection	introspection		that of	module provides the Dumper function that prints strings can be used by <u>eval</u> to rebuild the data. is similar to the x command of the debugger. ass reference to the variables, otherwise it extends then t and show each entry as its own variable.	• print Dumper \%hash;	
			comp	ides a dump function that has nicer output, but is not <u>e</u> r patible. ɪmp() prints on the stdout. No need to use print.	use Data::Dump qw(dump); dump(\@array); dump(\%hash);	
Data::Printer		• It p	per data dumper, not <u>eval</u> compatible. provides the p subroutine that does not require a referent the variable as it inspects it first. prints on the stdout. No need to use print.	use Data::Printer; p(@array); p(%hash);		
Modules for <u>Data Marshalling</u> • <u>Data Serialization in</u> <u>Perl</u>	There are several modules, either part of Perl core or outside, that provides mechanism to marshall/serialize and unmarshall/de-serialize data. • See the links at left for more info.				ınd unmarshall/de-serialize data.	

Topic: Directory Operations

		Topic. D	onectory Operations was	
Directory Operations	In Books: LPo			
Opening Files	All file open operations are relative to the <u>current working</u> relative file names)	ng directory (for	open my \$filehandle, '<:utf8', 'a_relative/path.txt'	
Creating temporary files	File::Temp (Perl >= v5.6.1). <u>Using File::Temp</u> • Also see <u>IO::File</u>			
Built-in Functions	Related Functions/Packages / Descriptions		Notes	
Getting file names by: • Globbing:	File::Glob (Perl >= v5.6.0) - provides more control.	Example:	<pre>my @all_files = glob '*'; my @perl_files = glob '*.pm *.pl'; # 2 globs, space-separat</pre>	ced
with globwith the glob operator <>	The <> operator is identifying: • a filehandle, when: the item inside <> is a Perl identifier or an indirect file handle read scalar, • a glob expression otherwise.	Glob examples:	<pre>my @all_files = <'*'>; my @all_files = <*>; # 1 glob: no space, no need for strin my @perl_files = <'*.pm *.pl'>; # 2 globs, space-separated</pre>	
operator <>	a giou expression otherwise.		<pre>my \$etc_dir = '/etc'; my @etc_dir_files = <\$etc_dir/* \$etc_dir/.*>;</pre>	
	A .		my @files = <larry *="">; # a glob</larry>	
	See: <u>readline</u>	Filehandle	<pre>my @his_lines = <larry>; # a filehandle read</larry></pre>	
		examples:	<pre>my \$name = 'LARRY'; my @his_lines = <\$name>; # indirect filehandle read of LARRY handle my @same_lines = readline LARRY; # another way to write abov my @same_lines = readline \$name;</pre>	
with a directory handle LPo	opendir: open a directory: get a directory handle readdir: read the directory handle. But see this. closedir: close the directory handle. DirHandle (Perl <= 5.5) File::Spec::Functions (Perl >= v5.5.4) Path::Class	Example: iterate explicitly over a list of file names extracted from the directory using these 3 functions.	opendir my \$dh, \$dir or die "Failed opening \$dir: \$!";	
Creating directory	• mkdir	Example:	<pre>mkdir \$dir_name, oct(\$permissions); # octal for permissions mkdir \$dir_name, 0700; # do not use "0700", it's 700 decima</pre>	
Removing directory	rmdir Removes an empty directory. File::Path remove tree, rmtree remove dir & files (Files).	Perl >= v5.0.1)		
Removing files	• unlink a list or \$_		<pre>unlink 'file1.txt', 'file2.txt'; unlink qw(file1.txt file2.txt); unlink glob 'file?.txt'</pre>	
Renaming files	rename an old file name to a new one. The fat comma operator is sometimes used to highlight what is the old and the new name.	As in here:	<pre>rename 'old_name' , 'new_name'; rename old_name => 'new_name'; # use fat comma to quote word left of it.</pre>	.1
Changing permissions	chmod changes file permissions			
Changing ownership	chown changes file ownership			
Creating Hard link	link to create a hard link			
Creating symbolic link	symlink to create a symbolic link			
chdir Change current working directory	File::chdir File::HomeDir	• <u>chdir</u> without a \$ENV{LOGDIR	urrent working directory. a rangument attempt to change to user home directory using the \$ENV{HOME} and R} environment values if A they are set. The File::HomeDir module helps in setting them. adir is global A for the entire program. Use File::chdir facilities for localized operations.	
Modules	Functions Legend: Exported by default, exported on request, W	/in32 specific	Extra Information	
Cwd	getcwd, cwd, fastcwd, fastgetcwd, getdcwd abs_path, realpath, fast_abs_path		<pre>use Cwd; my \$curdir = getcwd; print "cwd is \$curdir\n";</pre>	
File::Basename	fileparse, basename, dirname,			
File::SPec File::Spec::Functions	functional interface to methods: canonpath, catdir, splitpath, splitdir, catpath, abs2rel, rel2abs. All can b	catfile, curdir, roc pe imported by usi	otdir, updir, no upwards, file name is absolute, path. devnul, tmpdir, case tolerant, ing the : ALL tag.	

Topic: List Operations

List Operators				
Sorting lists	sort	Sort a list	<pre>my @sorted = sort @unsorted_list;</pre>	in place: my @data = sort @data;
	reverse	Sort a list in reverse order	<pre>my @rsorted = reverse @unsorted_list;</pre>	in place: my @data = reverse @data;
Filtering list with grep	my @adult_	_ages = <u>grep</u> \$_ > 18, @ages;	my @lucky_ages = grep /7\$/, @ages; # all that end with 7	my @read_ages = grep { \$_ >= 7 && \$_ <= 77 } @ages;
Counting matches	my \$count	= grep \$_ > 18, @ages;		
	An express	ion, subroutine or block with trailing b	poolean can be used as the grep criteria. Each item in the lis	t is identified inside grep by \$_
	The bloc	k is an anonymous subroutine. 🤞 Re	eturn a boolean from the subroutine, but fall-off, do not return	n, from a block!
Transform a list with map				

Topic: Process control

			Topic: Process control 🚧			
Process Control	In Books: LPo Important security information: peridoc perisec					
Environment Variables	Inside the <u>%ENV</u> hash.	Perl %Config ha	sh: Perl configuration information. For example, whether it support threads, what are path separators, etc e Config;			
Built-in Functions	Example		Description/ Note	Description/ Notes		
system (2 functions)	<pre>system 'ls -l \$HOME';</pre>		Run child process asynchronously using parent's stdin, std	out and stderr, using the OS native command shell.		
using the shellsecurity risk?	<pre>system "cd \$project;</pre>	make &";	,	Use the Unix shell to execute a long running build asynchronously. However: avoid using the shell like this. Using the shell to build commands from unvalidated user input data may lead to security issues.		
avoiding the shell	system 'tar', 'cvf', \$tarfile, @	directories;	No shell invoked when more than 1 argument is passed to	system. No shell interpretation, piping, re-direction done.		
other syntax	system('tar', @arguments);		0 means success: unless (system 'tar', argument	ts) { print "tar command success\n"; }		
	<u>system(</u> { \$prog }, \$arg0, @a	args);				
	Note that if the string contains	in no shell <u>metac</u>	haracters it is executed directly (not through a shell).			
system return value:	2 bytes: MSByte: child pro	gram exit code.	my \$retval = <u>system(</u>);			
A value of 0 usually means all was OK.	LSByte: system-sy information bits: • 0x80 : set on co • 0x7f : signal nu	ore dump.	<pre>my \$childp_exitcode = \$retval >> 8; my \$had_core_dump = (\$retval & 0x80) = my signal_number = \$retval & 0x7f;</pre>	 ← shift most significant byte = 0x80? 1 : 0; ← use least significant byte 		
exec	Unlike system, exec does not	return to the pare	nt Perl process. Use: <u>exec</u> 'the_program' or <u>die</u>	"Could not run: \$!"; #or warn or exit		
backquotes``	Use backquotes to capture the The trailing newline is not filt		gram. That's the main point of using it. e filter by <u>chomp</u> .	<pre>chomp(my \$current_date = `date`);</pre>		
	invoke the shell if there are a • The following example bu • Note that `` is also writter	any shell meta-cha iilds a dictionary (n as qx/ /	e the single double quote string argument of system: it will aracters and supports interpolation. hash) of topics with the text extracted from peridoc. 1 string. In list context it returns a list of strings (1 per line).	<pre>my @topics = qw(die warn exit); my %info; foreach (@topics) { \$info{\$_}} = `perldoc -t -f \$_`; }</pre>		
Modules						
Capture streams	Capture::Tiny Can be used to capture the stdout and stderr streams for various ways if executing other programs					
Inter-process support	IPC::System::Simple		o capture streams and provide more inter-process support. emx which never uses the shell, along with other useful functions.			
Processes as filehandles	In Books: <u>LPo</u>					
Perl - program	Launching a process that pipes into the Perl process	open DATE, 'dat	te or die "Cannot pipe from date: \$!";	Use a bare word to define the DATE file handle.		
	pipes into the Ferri process		fh, '- ', 'date' or die "Cannot pipe from date: \$!";	This one and the others define a local file handle variable. The file handle variable can later be used to read, as the		
		open my \$ps_fh	, '- ', 'ps', 'aux' or die "Cannot pipe from ps: \$!";	above one, but is not global.		
			ih, '- ', 'find', qw(name '*.p[lm]'-print) or die "Cannot pipe from find: \$!";			
Perl ➡ program	Launching a process that the Perl process pipes into.	open my \$dispa	ther_fh, ' -', 'dispatcher', qw ('-to-perl-groups' 'Help!') or c	die "Cannot pipe to the dispatcher: \$!";		
Forking	In Books: LPo . See also: Linu	ux <u>fork(2)</u> system	call, QA: Why do we need fort to create new processes? W	/hy fork woks the way it does?		
fork with exec and waitpid See also: Other IPC functions Perl IPC	 fork the process into parent and child. in the child process start the program with exec In the parent process wait for the program termination with waitpid defined(my \$process_id = fork) or die "Fork failed: \$!"; unless (\$process_id) { # Inside the child process (created by fork) exec 'long_running_process' or die "Failed starting long_running_process: \$!"; # Inside the parent process, wait for completion of long_running_process. waitpid(\$process_id, 0); 					
Signals	In Books: <u>LPo</u>					
kill	Sends a signal to a list of processes. • The signal may be identified by number or name (string), which is more portable. • The \$Config{sign_name} provides the supported signal names.					
	Note that the fat comma open	erator (=>) can be	used to automatically quote signal name:	kill INT => \$pid or die "Can't signal \$pid with SIGINT: \$!";		
	If the signal is 0 or "ZERO" r signal to the process: ie: if the signal to the process: ie: if the signal is 0 or "ZERO" representations of the signal	•	o the process; instead Perl checks if it's possible to send a	unless (kill 0, \$process_id) { warn "Process \$process_id is no longer running!"; }		
	If the signal is a negative nuidentified by the process sca		nat starts with '-' the signal is sent to the process group	• <u>kill</u> '-KILL', \$process_group • <u>kill</u> -9, \$process_group		
Signal handlers	Set the signal handler by set 'SIG' prefix) to a string holding			<pre>\$sig{'INT'} = 'dispatcher_int_handler';</pre>		

PerlTidy formatting control

perItidy option	Option	Impact
indentation style	-bl, opening-brace-on-new-line brace-left	 Without this option (the default) the code indentation style selected is <u>K&R style</u>. With this option, the indentation style is <u>Allman/BSD style</u>.
