Emacs support for Perl

Description	<u>Keystroke</u>	Function	<u>Note</u>		
Perl Editing	Emacs provides two major modes for Perl: <u>perl-mode</u> (Emacs default, simpler mode) and <u>cperl-mode</u> .				
See: Perl 5 Syntax • Activate Perl →	The <u>HaraldJoerg/cperl-mode</u> external package has support for new Perl language features. Fig. PEL activates Perl support with the <u>neture-perl</u> user ontions. When turned on:				
 Select major mode 	PEL activates Perl support with the pel-use-perl user-options. When turned on: • PEL provides supports all of them: pel-perl-mode selects the mode, using haraldJoerg/cperl-mode by default: it best supports Perl and perltidy . PEL instals the				
<u> </u>	upstream copy of perl-	mode from the HaraldJoerg/cperl-mode re	epo (which is what Emacs 30 uses) and the master copy of perl-tidy-ediff.		
• ∑ Speedbar. ⇒			nacs' own <u>cperl-mode</u> , remove the cperl-mode.el* and perl-tidy-ediff.el* files from ~/.emacs.d/utils y the pel-perl-activates-minor-modes user-option.		
		s on, speedbar support for Perl is activated.			
• <u>∑ Indentation</u> control		oth perl-mode and cperl-mode is controlled on the controlled on the controlled to the controlled t	d by the following user-options: I-indent-level and cperl-indent-level as well as tab-width.		
	The use of hard tabs is o	ontrolled by:	·		
DEL Dard assessed		tabs: it defaults to nil, forcing use of spaces	• •		
PEL Perl support improvements	face instead; by defaul	t this is a red background whitespace.	s. Set pel-cperl-show-trailing-whitespace-normally user-option to t to use the trailing-whitespace		
		pport for cperl-mode when pel-use-iedit is on the pert files in Perl directories. It supports			
	Integrated buffer-only	perltidy commands from HaraldJoerg/cper	-mode perl-tidy-ediff with improved command interface (2 commands do everything instead of 3).		
0 11 555 (1			vigation between compilation-mode error message and code.		
Open this PDF file. See also: <u>E Help/Info</u>	<f11> SPC P <f1></f1></f11>	(pel-help-pdf &optional OPEN-WEB-PAGE)	Open the <u>\$\Pi\$ - Perl</u> local PDF. With prefix argument (like C-u or M) opens the remote GitHub hosted raw PDF instead. If the pel-flip-help-pdf-arg user-option is set it's the other way around.		
	<f12> <f1></f1></f12>	<u> </u>	Troubled Tall 1 Di Indicada. Il dio por imp noip par dig acci option to detero dio dator way around.		
<u>S</u> Customize PEL Perl support	<f11> SPC P <f2></f2></f11>	(pel-customize-pel &optional OTHER-WINDOW)	Customize PEL Perl support. If OTHER-WINDOW is non-nil (use C-u), display in another window.		
зиррогі	<f12> <f2></f2></f12>		ii officit window is not till (use c-u), uspidy in allottic window.		
∑ Customize Emacs	<f11> SPC P <f3></f3></f11>	(pel-customize-library &optional	Customize Emacs Perl support: perl, cperl, electricity, perl-repl.		
Perl support	<f12> <f3></f3></f12>	OTHER-WINDOW)	 If OTHER-WINDOW is non-nil (use C-u), display in another window. 		
Show perl-mode status	<f12> <f4> ?</f4></f12>	(pel-perl-show-status &optional	Show current buffer 'cperl-mode' status in specialized *pel-perl-info* buffer.		
		APPEND)	 Clear previous buffer content (and move point to top of buffer) unless optional APPEND argument is non-nil,in which case it appends to the previous report and move point to the end of buffer. 		
PCRE support	See PCRE support in V	Search/Replace for commands to activate	Perl Compatible regular expression search and operations.		
Perl Doc			rt provides access to the Perl documentation available on your system.		
<u>. 511 200</u>			, man perlintro provides the same information as given by the perldoc perlintro command.		
	The Perl Documentation	web page provides the complete information	n on-line:		
	• Overview	Operators ModulesFunctions Utilities	History Internals and C Language Interface Miscellaneous		
	Tutorials Reference Manual	<u>Functions</u> <u>Utilities</u><u>Variables</u>	 Internals and C Language Interface Language-specific Miscellaneous Platform-specific 		
Show command info	C-c C-h F	(cperl-info-on-command COMMAND)	Show documentation for Perl command COMMAND in other window.		
			 If perl-info buffer is shown in some frame, uses this frame. Customized by setting variables 'cperl-shrink-wrap-info-frame', 'cperl-max-help-size'. 		
peridoc at point	• C-c C-h P	(cperl-perldoc-at-point)	Run a 'perldoc' on the word around point to show information about that Perl word.		
	• <f12> ?</f12>				
	C-c C-h p	(cperl-peridoc WORD &optional SECTION)	Prompt for for (default to word at point). Show information about the selected word with 'perldoc'.		
Show Perl doc	C-c C-h f	(cperl-info-on-current-command)	Show documentation for Perl command at point in other window.		
Help on symbol at	C-c C-h v	(cperl-get-help)	Get one-line docs on the symbol at the point.		
point	C-e C-n v	(cperi-get-rieip)	The data for these docs is a little bit obsolete and may be in fact longer than a line.

Description	<u>Keystroke</u>	Function	Note	
Navigation Commands	Some navigation commands have special behaviour for Perl; they are shown below. They are available in perl-mode and cperl-mode . • There's also several generic navigation commands that work in Perl buffer too. See • Ravigation for those.			
Move to beginning of function	• C-M-a • <f12> <up></up></f12>	(perl-beginning-of-function &optional ARG)	Move backward to next beginning-of-function, or as far as possible. With argument, repeat that many times; negative args move forward.	
To end of function	• C-M-e • <f12> <down></down></f12>	(perl-end-of-function &optional ARG)	Move forward to next end-of-function. The end of a function is found by moving forward from the beginning of one. With argument, repeat that many times; negative args move backward.	
Move to next interpolated	C-c C-v	(cperl-next-interpolated-REx &optional SKIP BEG LIMIT)	 With argument, repeat that many times, negative args move backward. Move point to next REx which has interpolated parts. SKIP is a list of possible types to skip, BEG and LIMIT are the starting point and the limit of search (default to point and end of buffer). SKIP may be a number, then it behaves as list of numbers up to SKIP; this semantic may be used as a numeric argument. Types are 0 for / \$rex /o (interpolated once), 1 for /\$rex/ (if \$rex is a result of qr//, this is not a performance hit), t for the rest 	
	C-c C-x	(cperl-next-interpolated-REx-0)	Move point to next REx which has interpolated parts without //o.	
	С-с С-у	(cperl-next-interpolated-REx-1)	Move point to next REx which has interpolated parts without //o. Skips RExes consisting of one interpolated variable. Note that skipped RExen are not performance hits.	
Marking Commands	The following marking co	ommands are specialized for Perl. See <u>E Ma</u>	arking for the generic ones that can also be used in Perl buffers.	
Mark function	C-M-h	(perl-mark-function)	Put mark at end of Perl function, point at beginning	
Indentation Control	_		. See <u>Indentation</u> for the generic ones that can also be used in Perl.	
Show currently used	• The indentation behave	riour of the <tab> key is controlled by the p (pel-perl-show-style)</tab>	perI-mode and cperI-mode customization user-options. Use <f12> <f3> to open customization. Show the name of the currently used indentation style.</f3></f12>	
indentation style Select new/restore old indentation style	<f12> <f4> <tab></tab></f4></f12>	(pel-perl-set-style)	Set Perl indentation style to named style. Prompt for indentation style name and apply it. A This change does not persist. Manually access the customized buffer and save it.	
Indent	<tab></tab>	(perl-indent-command &optional ARG)	Indent Perl code in the active region or current line.	
• perl-mode →		por moon command copilonal (iii)	 In Transient Mark mode, when the region is active, reindent the region. Otherwise with a prefix argument, reindent the current line unconditionally. Otherwise if 'perl-tab-always-indent' is nil and point is not in the indentation area at the beginning of the line, insert a tab. Otherwise, indent the current line. If point was within the indentation area, it is moved to the end of the indentation area. If the line was already indented properly and point was not within the indentation area, and if 'perl-tab-to-comment' is non-nil (the default), then do the first possible action from the following list: delete an empty comment move forward to start of comment, indenting if necessary move forward to end of line create an empty comment move backward to start of comment, indenting if necessary. 	
• cperl-mode ►		(cperl-indent-command &optional WHOLE-EXP)	Indent current line as Perl code, or in some cases insert a tab character. • If 'cperl-tab-always-indent' is non-nil (the default), always indent current line. Otherwise, indent the current line only if point is at the left margin or in the line's indentation; otherwise insert a tab. • A numeric argument, regardless of its value, means indent rigidly all the lines of the expression starting after point so that this line becomes properly indented. The relative indentation among the lines of the expression are preserved.	
Indent continued expression	C-M-q	(perl-indent-exp)	Indent each line of the Perl grouping following point.	
• cperl-mode ⇒		(cperl-indent-exp)	Simple variant of indentation of continued-sexp. Won't indent comment if it starts at 'comment-indent' or looks like continuation of the comment on the previous line. If 'cperl-indent-region-fix-constructs', will improve spacing on conditional/loop constructs.	
Indent region	C-M-\	(cperl-indent-region START END)	Indents all the lines whose first character is between START and END inclusive. • Won't indent comment if it starts at 'comment-indent' or looks like continuation of the comment on the previous line. • If 'cperl-indent-region-fix-constructs', will improve spacing on conditional/loop constructs.	
Newline and indent • cperl-mode ➡	С-ј	(newline-and-indent)	Insert a newline at point, then indent the newly created line. Use it to split a line. • Indentation is done using the value of 'indent-line-function' which is set to cperl-indent-line.	
Insert Perl new line	C-c C-j	(cperl-linefeed)	Go to end of line, open a new line and indent appropriately. If in POD, insert appropriate lines.	
	It's a convenience replac	ement for typing return . It puts point in the	e next line with proper indentation, or if you type it inside the inline block of control construct, like	
	<pre>foreach (@lines) {print; print}</pre>			
			form the construct into a multiline and will place you into an appropriately indented blank line.	
Incort matching navons	• Use C-j for usual 'newline-and-indent' behavior. See ' cperl-electric-linefeed ' documentation.			
Insert matching parens toggle with C-c C-e	• (• < • [• {	(cperl-electric-paren ARG)	 Insert an opening parenthesis or a matching pair of parentheses. Controlled by 'cperl-electric-parens' and 'cperl-hairy' user-options. 	
	•)	(cperl-electric-rparen ARG)	Insert a matching pair of parentheses if marking is active. If not, or if we are not at the end of marking range, would self-insert. Controlled by 'cperl-electric-parens' and 'cperl-hairy' user-options.	
Insert : and indent	:	(cperl-electric-terminator ARG)	Insert character and correct line's indentation.	
Insert ; and indent	;	(cperl-electric-semi ARG)	Insert character and correct line's indentation.	
Insert { and indent	{	(cperl-electric-lbrace ARG &optional END)	Insert character, correct line's indentation, correct quoting by space.	
Insert } and indent	}	(cperl-electric-brace ARG &optional ONLY-BEFORE)	Insert character and correct line's indentation. • If ONLY-BEFORE and 'cperl-auto-newline', will insert newline before the place (even in empty line), but not after. If after ")" and the inserted char is "{", insert extra newline before only if 'cperl-extranewline-before-brace'.	
Deleted and possibly untabify	DEL	(cperl-electric-backspace ARG)	Backspace, or remove whitespace around the point inserted by an electric key. • Will untabify if 'cperl-electric-backspace-untabify' is non-nil.	
cperl-mode		ode implementations: Emacs' cperl-mode mmands toggle some of its electric behavio	and WaraldJoerg/cperl-mode (more complete) activated by the pel-use-perl user-option.	
toggle Perl auto-help	C-c C-h a	(cperl-toggle-autohelp)	Toggle the state of Auto-Help on Perl constructs (put in the message area). • Delay of auto-help controlled by 'cperl-lazy-help-time'. A By default it is nil, which (like null) prevents activation of the auto-help. To activate it, set cperl-lazy-help-time to an integer value.	
Toggle auto-newline	C-c C-a	(cperl-toggle-auto-newline)	Toggle the state of 'cperl-auto-newline'.	
Toggle electric mode	C-c C-e	(cperl-toggle-electric)	Toggle the state of parentheses doubling in CPerl mode. When typing an opening parens character the closing one is automatically entered.	
Toggle auto-fill mode	C-c C-f	(auto-fill-mode &optional ARG)	Toggle automatic line breaking (Auto Fill mode).	
	• <f11> t f a • <f11> RET</f11></f11>		 With a prefix argument, enable Auto Fill mode if the prefix argument is positive, disable it otherwise. When Auto Fill mode is enabled, inserting a space at a column beyond 'current-fill-column' automatically breaks the line at a previous space. 	

Description	Keystroke	runcuon	Note
Toggle keyword expansion	C-c C-k	(cperl-toggle-abbrev)	Toggle the state of automatic keyword expansion in CPerl mode.
Toggle space fix	C-c C-w	(cperl-toggle-construct-fix)	Toggle whether 'indent-region'/'indent-sexp' fix whitespace too.
here-doc support	The following cperl-mode commands operate on Perl here documents .		
Narrows to here-doc	C-c C-n	(cperl-narrow-to-here-doc &optional POS)	Narrows editing region to the HERE-DOC at POS. POS defaults to the point.
Spell-check here-docs	C-c C-d	(cperl-here-doc-spell)	Spell-check HERE-documents in the Perl buffer. • If a region is highlighted, restricts to the region.
Spell-check POD documentation	С-с С-р	(cperl-pod-spell &optional DO-HERES)	Spell-check POD documentation. If invoked with prefix argument, will do HERE-DOCs instead. If a region is highlighted, restricts to the region.
Verify & refactor Perl code	The following commands provide Perl verification and refactoring facilities.		
• perltidy	The following 2 commands run pertidy between areas of the Perl code in the current buffer and the tidied version of that code. All work is done inside Emacs buffers, no file is affected. After generating the tidied code the functions open an ediff session to compare your code and the tidied code, allowing you to decide what to use. Requires HaraldJoerg/cperl-mode activated by the pel-use-perl user-option. The perl-tidy-ediff commands execute the perltidy identified by perl-tidy-command user-option with options identified by the perl-tidy-ediff-args user-option. See Perl::Tidy @meta::cpan for the perltidy list of options, also Online PerlTidy, which provides help on the various options categorized by feature set.		
Run perltidy on current buffer or region . Ediff changes.	<f12> T</f12>	(pel-perl-tidy-ediff)	Run perltidy on current buffer, than start an ediff session, comparing the original source with perltidy output. Error messages are saved in the *perl-tidy-errors* buffer. • If an area is marked, run perltidy on the marked area only.
Run peritidy on current subroutine. Ediff changes. See Narrowing	<f12> t</f12>	(perl-tidy-ediff-sub)	Run the peritidy program on the subroutine that stats before point and start en ediff session to compare the original code with the tidied version. • Error messages are saved in the *perl-tidy-errors* buffer. • The buffer is automatically narrowed to the current function. • When quitting the ediff session it remains narrowed. Use C-x n w to widen the buffer back.
• pericritic	Perform static code analy	ysis with perlcritic (which must be installed	separately).
Check code with pericritic	<f12> c</f12>	(pel-perl-critic &optional VERBOSE)	Validate the Perl file visited in current buffer with perloritic. Report error if it's not installed. • With optional VERBOSE prefix argument, print extra information: • Full name of the Policy module that created the violation • Full diagnostic discussion of each Perl Best Practice (PBP) violation. Show errors in compilation-mode buffer in a format that allows navigation.
Other refactoring			
Find/fix missing whitespace code	C-c C-b	(cperl-find-bad-style)	Find places in the buffer where insertion of a whitespace may help. • Prompts user for insertion of spaces. Currently it is tuned to C and Perl syntax.
Refactor: if (A) {B}' ↔ 'B if A;'	C-c C-t	(cperl-invert-if-unless)	Change 'if (A) {B}' into 'B if A;' etc (or visa versa) if possible. If the cursor is not on the leading keyword of the BLOCK flavor of construct, will assume it is the STATEMENT flavor, so will try to find the appropriate statement modifier.
Lining up Perl Code : X Align	It's often best to line up Perl code vertically, arranging elements as tables, to help reader understand the code intent visually. • This technique is also promoted in <u>Damian Conway's Perl Best Practice book, Vertical Alignment section of chapter 2</u> . See <u>pel-align-words-vertically</u> in <u>E Align</u> .		
Lineup	• C-M- • <f12> </f12>	(cperl-lineup BEG END &optional STEP MINSHIFT)	Lineup construction in a region. Beginning of region should be at the start of a construction. All first occurrences of this construction in the lines that are partially contained in the region are lined up at the same column. MINSHIFT is the minimal amount of space to insert before the construction. STEP is the tabwidth to position constructions. If STEP is nil, 'cperl-lineup-step' will be used (or 'cperl-indent-level', if 'cperl-lineup-step' is nil). Will not move the position at the start to the left.
Testing Perl code	The following command	provides a way to test Perl code locally. See	e <u>Perl 5 Syntax</u> for web-sites that provide a Perl interpreter.
Start Perl REPL	<f11> z r P</f11>	(perl-repl)	Run a Perl REPL in a *Perl-REPL* buffer.
See: <u>S start Shells/</u> <u>REPLs</u>	<f12> z</f12>		 Requires the perl-repl external package activated by perl-use-perl-repl user-option. The perl-repl-file-path user option specifies the name of the Perl REPL program, which may optionally specify the explicit file path. PEL provides the perl-repl shell script which uses the Perl command line.
