	GNU Make Manuals :	GNU Make Top page How to run make GNU Make - Appendix A - Quick Reference Makefile Conventions Autoconf Portable Make Programming	GNU Make @ mad-scientist.net , from it's maintainer, Paul D. Smith. It identifies the latest version of GNU Make, describes how to build GNU Make from source and what is required.	Related GNU tools: • automake J • autoconf • gettext • m4			

		Including Other	er Makefiles					
Include makefiles	ude makefiles include filenamesinclude		-include file			e so that make ignores a makefile which does not exist or de, with no error message.		
				sinclude filename		sinclude is supported for compatibility with other make implementations.		
GNU Make Escaping	dollar := \$\$	pound :=	\#	See Examples on how to the \$ and # characters must			·	
	GNU Make Rules				(See section on implicit rules below)			
opic	Rule syntax format				Description			
Rule Syntax	targets : prerequisites recipe				The recipe line	Multiple line recipe, the on mostly used. The recipe lines must start with a TAB character (or the string identified by the .RECIPEPREFIX pseudo-variable.		
	targets : prerequisites ; recipe recipe				them by a sem	ssible to to identify a recipe on the same line as the prerequisites, separated emicolon. v writing a single-line rule.		
Wildcards	Wildcards can be us	ed in targets and p	rerequisites.		* All files, like '*.c'			
	They are expande They are not expande See wildcard e	anded in variable d			?	Expand to characters		
	But wildcard fu			riable definition as	[]			
	iii. Objects .	- y(wilucalu	.0)		~	At beginning of p	ath name, like ~/bin expands to yo	our home bin directory
					~user	Expands the the	home directory of specific user	
Searching directories	<u>VPATH</u>			ble specifies a list of		Example:		
Γ <u>he Basics: VPATH</u>		On Unix-like	OS: spa	y in the list can be a ace or :	separated by:	VPA	TH = src:/headers	
and vpath			, <u>Windows</u> : spa	•				
Selective search	vpath directive			: only applies to a p mat is one of the 3		The first form set the following:	s the directory search for a specifi	ed file name pattern, like
Use vpath to find sources, not targets.			tern director	scope (file pattern of ies set search of par clear search par clear search par	attern to directories th for specified pattern	vpath %.h/headers		
Directory search for Link Libraries	Note: that make trea expanded to the full For example:		name with starts v				lowing command to be executed it	
		This he	haviour is custom	nizahla hv tha IIRI	PATTERNS special	l variable.

File Name Functions	For each of these functions the argument is regarded as a series of file names, separated by whitespace. Each file name in the series is transformed the same way and the results are concatenated with single spaces between them.						
	\$(dir names) \$(notdir names) \$(suffix names)	<pre>\$(basename names) \$(addsuffix suffix,names) \$(addprefix prefix,names)</pre>		\$(join list1,list2) \$(wildcard pattern) \$(realpath names) \$(abspath names)			
Conditional Functions	<pre>\$(if condition,then-part[,else-part])</pre>	<pre>\$(or condition1[,condition2[,condition3]])</pre>		<pre>\$(and condition1[,condition2[,condition3]])</pre>			
The foreach Function	\$(foreach var,list,text)	An example of this is show next:	<pre>dirs := a b c d files := \$(foreach dir,\$(dirs),\$(wildcard \$(dir)/*))</pre>				
The file Function	<pre>\$(file op filename[,text])</pre>	Used to read or write from a file. For example, the following write commands to execute in a temporary command file that it executes then deletes:	<pre>program: \$(OBJECTS) \$(file >\$@.in,\$^) \$(CMD) \$(CMDFLAGS) @\$@.in @rm \$@.in</pre>				
The call Function	<pre>\$(call variable,param,param,)</pre>	The following example reverses the arguments:	reverse = \$(2) \$(1) foo = \$(call reverse,a,b)				
		This sets variable LS to the path of the path of the ls program, something like /bin/ls	<pre>pathsearch = \$(firstword \$(wildcard \$(addsuffix /\$(1),\$ (subst :, ,\$(PATH))))) LS := \$(call pathsearch,1s)</pre>				
The value Function	\$(value variable)	Provides a way to use the value of a variable without having it expanded.					
The eval Function	\$(eval expression)						
The origin Function	\$(origin variable)	Returns how the variable was defined. It can return one of the following: undefined, default, environment, environment override, file, command line, override, automatic.			undefined, default, environment,		
The flavour Function	\$(flavor variable)	Returns the flavour of the variable. It can be one of the following: undefined, recursive, simple.					
Functions that control Make	These functions control the way Make runs and are used to provide information to the user.	\$(error text)	\$(warning tex	t)	\$(info text)		
The shell Function	The shell function performs command expansion similar to what backquote does in the s • After the \$(shell) execution, the exit status is placed inside the .SHELLSTATUS variable. • See the following examples:		To set the content space separating contents := \$ foo)	each line:	Set files to a space separated list of C file names: files := \$(shell echo *.c)		
The guile Function	If GNU Make is built with Guile support the .FEATURES variable for evaluation. See GNU Guile Integration .	ariable includes the word guile. The	guile function is the	n available. Make	expands its argument then it is passed to		

GNU Make Implicit Rules

Implicit Rule Topic	Description							
Using Implicit Rules	 To use them refrain from writing the recipe for a kind of target. Each implicit rule has a target and prerequisite patterns. Write a rule to identify extra prerequisites like header files prerequisites to an object file. There may be several implicit rules for the same target (for example a rule to generate object file from C files, another rule to generate object file from C++ files). See the catalogue of built-in-rules. It is possible to cancel an implicit rule. Make searches for implicit rules for: each target that has no recipe, each double-colon rule that has no recipe, a file that is only mentioned as a prerequisite. The Implicit Rule Search Algorithm describes how the search for an implicit rule is done. A chain of implicit rules can be used to make the target from a prerequisite. But only one instance of an implicit rule can only be used in the chain. It's possible to define last-resort default rules to override part of another makefile. To prevent an implicit rule to apply to a specific target create an empty recipe for that target. 							
Pattern Rules	Example: The example pattern rule says how to make stem.o from another file stem.c Expansions using '%' in pattern occurs after any variable and function expansion. Tecipe The example pattern rule says how to make stem.o from another file stem.c The example pattern rule says how to make stem.o from another file stem.c The example pattern rule says how to make stem.o from another file stem.c The example pattern rule says how to make stem.o from another file stem.c The example pattern rule says how to make stem.o from another file stem.c The example pattern rule says how to make stem.o from another file stem.c The example pattern rule says how to make stem.o from another file stem.c The example pattern rule says how to make stem.o from another file stem.c							
		Special GNU Make Variables						
Make Goals	MAKECMDGOALS	This variable is set to the list of targe	ets (goals) specifie	ed in the command	d line. If there were none, the variable is empty.			
	<u>Variables</u>	used in Implicit Rules						
Variable Name	Description		Default value	Flag Variable	Description and default value (if any)			
AR	Archive-maintaining	program	ar	ARFLAGS	Flags to give the archive-maintaining program; default 'rv'			
AS	Program for compilir	· · ·	as	ASFLAGS	Extra flags to give to the assembler (when explicitly invoked on a '.s' or '.S' file)			
СС	Program for compilir	ng C files	СС	CFLAGS	Extra flags to give to the C compiler.			
схх	Program for compilir	ng C++ files	g++	CXXFLAGS	Extra flags to give to the C++ compiler.			
СРР	Program for running the C preprocessor, with results to standard output		\$(CC) -E	CPPFLAGS	Extra flags to give to the C preprocessor and programs that use it (the C and Fortran compilers).			
FC	Program for compiling or preprocessing Fortran and Ratfor files		f77	FFLAGS RFLAGS	Extra flags to give to the Fortran compiler. Extra flags to give to the Fortran compiler for Ratfor files.			
M2C	Program to compile	m2c						
PC	Program to compile		рс	PFLAGS	Extra flags to give to the Pascal compiler.			
CO	Program for extraction		со	COFLAGS	Extra flags to give to the RCS co program.			
GET	Program for extraction	ng a file from SCCS	get	GFLAGS	Extra flags to give to the SCCS get program.			
LEX	Program for extracting a file from SCCS Program to use to turn Lex grammars into source code		lex	LFLAGS	Extra flags to give to Lex.			
YACC	Program to use to turn Yacc grammars into source code		yacc	YFLAGS	Extra flags to give to Yacc.			
LINT	Program to use to run lint on source code		lint	LINTFLAGS	Extra flags to give to lint.			
MAKEINFO		a Texinfo source file into an Info file	makeinfo					
TEX		X DVI files from TeX source	tex					
TEXI2DVI		X DVI files from Texinfo source	texi2dvi					
WEAVE	_		weave					
CWEAVE	Program to translate Web into TeX Program to translate C Web into TeX		weave					
TANGLE	Program to translate		tangle					
CTANGLE	Program to translate C Web into C		tangle					
RM	Command to remove		rm -f					
				LDFLAGS	Extra flags to give to compilers when they are supposed to invoke the linker, 'ld', such as -L. Libraries (-lfoo) should be added to the LDLIBS instead.			
				LDLIBS	Library flags or names given to compilers when they are supposed to invoke the linker, 'ld'. Non-library linker flags, such as -L, should go in the LDFLAGS			
				LOADLIBES	Deprecated (but still supported) alternative to LDLIBS.			

Automatic Variable	Expands to	Notes and examples
\$@	File name of the target. For archive(member): name or archive.	
\$(@D)	The directory part of the target	If the target is just a file name, then the value of \$(@D) is .
\$(@F)	The file name (with extension) of the target	
\$%	File name of target archive member	
\$(%D)	The directory part of the target archive member	
\$(%F)	The file name (with extension) of the target archive member	
\$<	Name of the first prerequisite	
\$(<d)< td=""><td>The directory part of the prerequisite</td><td></td></d)<>	The directory part of the prerequisite	
\$(<f)< td=""><td>The file name (with extension) of the prerequisite</td><td></td></f)<>	The file name (with extension) of the prerequisite	
\$?	Names of all prerequisites newer than target with spaces between them. • For archive(member), only contain the member.	Also useful in explicit rules when the receipt must operate on only the prerequisites that have changed.
\$(?D)	List of the directory part of all prerequisites newer than target	
\$(?F)	List of the file name (with extension) of all prerequisites newer than target	
\$^	The names of all prerequisites with spaces between them. For archive(member), only contain the member. No duplicates in the list	Does not contain order-only prerequisites.
\$(^D)	List of the directory part of all prerequisites (no duplicates)	
\$(^F)	Lis of the file name (with extension) of all prerequisites (no duplicates)	
\$+	The names of all prerequisites with spaces between them. For archive(member), only contain the member. Duplicates are allowed in the list in the same order as received	Useful when linking where it might be required to repeat the name of a library
\$(+D)	List of the directory part of all prerequisites (with duplicates)	
\$(+F)	List of the file name (with extension) of all prerequisites (with duplicates)	
\$	The names of all order-only prerequisites with spaces between them.	
\$*	For implicit rule: the stem which an implicit rule matches. For explicit rule, there is no <i>stem</i> : expands to the target name minus the suffix.	Implicit rule: if target is dir/a.foo.b and the target pattern is a.%.b then the stem is dir/foo Explicit rule: If target is foo.c, then \$* expands to foo.
\$(*D)	The directory part of the stem	
\$(*F)	The file name (with extension) of the stem	

Suffix Rules - Obsolete Old-fashioned Suffix Rules

Kinds of old-fashioned suffix rule	Example of suffix rule	Corresponding pattern rule	Description		
double-suffix	.c.o	%.o:%.c	Matches any file whose name ends with the target suffix.		
single-suffix .c %:%.c Matches any file name, and the corresponding implicit prerec		Matches any file name, and the corresponding implicit prerequisite name is made by appending the source suffix			
	The old-fashioned suffix rules are obsolete because the pattern rules are more general and clearer. • Suffix rules cannot have any prerequisites of their own. • Suffix sure without recipe are meaningless.				

Assignment operators

	-	-	
OP	Description	Example	
	Rules		
:		non-terminal	
::	Makes the rule terminal: it's prerequisite may not be an intermediate file.		
	Using Variables		
=	Non-terminal recursively expanded variable assignment. See: • The two-flavours of Variables • Setting Variables	The following will echo Huh?:	<pre>foo = \$(bar) bar = \$(ugh) ugh = Huh? all:;echo \$(foo)</pre>
:=	Simply expanded variables See: The two-flavours of Variables	The following: $ \begin{array}{c} x := foo \\ y := \$(x) \ bar \\ x := later \end{array} $	is equivalent to: y := foo bar x := later
::=	Simply expanded variables - 2012 POSIX standard compliant. See: The two-flavours of Variables	The following: x ::= foo y ::= \$(x) bar x ::= later	is equivalent to: y ::= foo bar x ::= later
?=	Set variable if it is not already set. See: • Setting Variables	The following: FOO ?= bar	is equivalent to: ifeq (\$(origin F00), undefined) F00 = bar endif
!=	Shell assignment operator: used to execute a shell script and set a variable to its output. See: Setting Variables	For example, if you don't expect a \$ character to be part hash != printf '\043' file_list != findname '*.o	
	Note that after the != execution, the exit status is placed inside the .SHELLSTATUS variable.	If you expect \$ character(s) to be part of the output, the hash := \$(shell printf '\043' var := \$(shell findname ")
+=	Append text to a variable The text append operation is affected by the flavour of the original variable assignment (by = or := operators.)	The following: objects = main.o foo.o bar.o objects += another.o is equivalent to: objects = main.o foo.o bar.o objects := \$(objects) another	utils.o
	The Override Directive : how to set a variable in the make file even if the user has set it with a command argument.	To override a variable that might have been set in the converride variable = value or	ommand line:
	Appending More Text To Variables	override variable := value To append more text to a variable defined on the comm override variable += more text	and line:
	Defining Multi-Line Variables	It's also possible to override directives with define direction override define foo = bar endef	tive:
