## VCS — Git Support via VC and Magit 🚧

| <u>Operation</u>  | Keystroke   | Function   | <u>Note</u>   |
|---|---|--|---|
| Emacs Git Support See also: VCS-Mercurial Magit Cheatsheet Reference Card Magit Homepage    | Emacs supports Git through two different packages:  1. Emacs VC built-in package, which has a common UI for all version control system backends.  • It works fine with Git and can easily be used for the most common Git commands. Its simple interface is often good enough and simpler to use for simple Git operations like adding/staging files, committing changes, pushing changes to a parent repo. The interface is the same whether you use Git, Mercurial or other VCS supported as VC back-ends.  2. PEL downloads and activates it when the pel-use-magit user-option is turned on.  |  |   |
| <ul> <li>Visual walk-through</li> <li>Magical Git Interface</li> </ul>                      | <ul> <li>Magit is much more flexible than the VC interface. It's considered one of Emacs killer features.</li> <li>It helps learn Git features and has extensive support for Git commands.</li> </ul>   |  |   |
| Open this PDF file. See also: <u>Nelp/Info</u>  | <f11> v <f1><br/><f12> <f1></f1></f12></f1></f11>   | (pel-help-pdf &optional OPEN-WEB-<br>PAGE)   | Prompt to open one of the VCS PDF files like the <u>NVCS-Mercurial</u> local PDF. If the prefix argument (like <b>C-u</b> or <b>M</b> ) is used, then it opens the remote GitHub hosted raw PDF instead. If the <b>pel-flip-help-pdf-arg</b> user-option is set it's the other way around.  |
| <u> </u>  | <f11> v <f2><br/><f12> <f2></f2></f12></f2></f11>   | (pel-customize-pel &optional OTHER-WINDOW)   | Customize PEL Version Control System support.  • If OTHER-WINDOW is non-nil (use <b>c-u</b> ), display in other window.   |
| <u>     ∑ Customize</u> Emacs VCS control   | <f11> v <f3></f3></f11>   | (pel-customize-library &optional OTHER-WINDOW)   | Customize Emacs Version Control System support: vc, vc-hg, vc-git, magit, monky.  Customize Emacs Version Control System support: vc, vc-hg, vc-git.  |
| Emacs Built-in VCS package: <u>VC</u>   | <ul> <li>The VC library sup<br/><u>CVS</u> and <u>Subvers</u></li> <li>When visiting a direpository, set the</li> </ul>   | sion, Bazaar, Git, Mercurial and Monoton<br>rectory or a file and using a VC command to<br>variable vc-dir-backend and adjusts its ba  | wc-handled-backends user-option, which, by default, identifies: RCS and SCCS, to manage the repository, VC automatically detects the (D)VCS type for the lockend accordingly. If the directory has a .git directory or is enclosed in a directory backend and the commands behaves as described in this table.  |
| Forcing selection of a<br>VCS backend for VC<br>commands                                    | The commands in the VC built-in package automatically detect the VCS backend and use it for all their commands.  • Unfortunately, if a directory tree is managed by more than one VCS tool, the tool selected by the VC commands may not be the one you want.  For example if a directory tree is managed both by Git (there is a .git directory in the parent directories) and by Mercurial (and there is a .hg directory in the parent directories) then VC will select Git because its code looks for Git before it looks for Mercurial.  You can force the selection of a specific VCS backend by using one of the following methods:  1. Select a different VCS when issuing the vc-dir command by typing the C-u prefix before the command keystroke.   |  |   |
| Select VCS backend with directory local variable     See also:     File/Directory Variables | Select a different in the directory prommand can be a violated with the first selection of the first selectio | t VCS back-end one file at a time, using the parents, then prompt for the one to use and e invoked directory but it does not seem to Instead use a VCS-specific tool. Like <b>May</b> and for the directory using a directory localing in a .dir-locals.el file if the file is empty: a contains a list, insert the following entry in | e pel-vcs-switch-backend command. It searches for the VCS repository directories is switches to it using the vc-switch-backend command. The vc-switch-backend of work when trying to to switch backend in a multi-backend directory environment. git for Git and Monky for Mercurial.  I variable:  ((vc-dir-mode . ((vc-dir-backend . Hg)))) In the list: (vc-dir-mode . ((vc-dir-backend . Hg))) Indicated to the safe-local-variable-values, by adding the following statement inside the                                      |
| Detect available VCS backend and switch to one selected                                     | <f11> v s</f11>   | (pel-vcs-switch-backend)   | Switch VCS back-end for the current file.  If no VCS back-end or only one VCS back-end is available for the file, the command issues an error, otherwise it prompts for the VCS back-end to use and switch the VCS back-end for this file. The switch is temporary: it is restricted to the current Emacs session.  Use this command when the file is managed by more than one VCS back-end.  This uses the function 'vc-switch-backend' to perform the switch.   |
| Switch VCS backend  | С-х v b   | (vc-switch-backend FILE BACKEND)   | Make BACKEND the current version control system for FILE.  • FILE must already be registered in BACKEND. The change is not permanent, only for the current session. This function only changes VC's perspective on FILE, it does not register or unregister it.  • By default, this command cycles through the registered backends.  • To get a prompt, use a prefix argument.  ⚠ This command does not seem to be working if a directory is both managed by Mercurial and Git. Use pel-vcs-switch-backend instead, it does work. |
| Open the VCS Status<br>Window   | The buffer shows     The buffer suppor     These comm   | the status of files unregistered, modified at<br>ts a set of commands, mostly single chara   | cter commands to quickly perform operations on the repository.  ground beside globally bound commands that can be issued from any buffer.   |
| Type ? for help.  | For a list of the the   | e key bindings available in the *vc-dir* buff  | er use the <b>describe-mode</b> command: (type ? in the buffer's window).   |
| Open a VC Status buffer  List status of files in *vc dir*  buffer                           | • C-x v d<br>• <f11> v v</f11>  | (vc-dir DIR &optional BACKEND)   | Executes: git status. Open a *vc dir* buffer that shows the git status of files.  Type C-u prefix to request a different VC backend: the command prompts for the backend to use instead of selecting the default one.   |
| git status  |   | <ul><li>The list omits files which are up to date</li><li>Preparing the list of file status takes tin</li></ul>  | in and below DIR. This allows you to mark files and perform VC operations on them. s, with no changes in your copy or the repository, and nothing special about them. ne; when the buffer first appears, it has only the first few lines of summary To speed it up, specify a sub-directory to reduce the work-load.  |
| Control <u>.gitignore</u>   | Identify files that must not be managed by Git with the <u>.gitignore file</u> .   Activate installation and use of the <u>git-modes</u> external package with the pel-use-gitignore-mode user-option.  This provides the gitattributes-mode, gitconfig-mode and the gitignore-mode which allows Emacs to font lock the appropriate files.  |  |   |
| Ignore a file (update<br>the .hgignore file)  | files. DIRECTOF  • When called interal list of ignored files  | RY defaults to 'default-directory' and is use actively, prompt for a FILE to ignore, unless s.   | Update the depot's .gitignore file to ignore a specific file or files.  • Ignore FILE under the VCS of DIRECTORY.  les to be ignored. When REMOVE is non-nil, remove FILE from the list of ignored d to determine the responsible VC backend.  s a prefix argument is given, in which case prompt for a file FILE to remove from the  |
|   | G   | (vc-dir-ignore)  | Ignore the current file; update the .gitignore file.  |
| Ignore all marked files   | ! You can hide files th   | (pel-vc-ignore-marked)   | Ignore all marked files: update the .gitignore file.  |
| Hide enseits states   |   | at are in specific state (like unregistered) b   |   |
| Hide specific states  | Н   | (pel-vc-dir-hide STATES)   | Hide lines corresponding to specified STATES. Prompt for state with tab completion. Press <b>g</b> to refresh list and display all states again.  |

| <u>Operation</u>   | Keystroke  | Function  | Note   |
|--|--|---|--|
| Log Git commands   | Log the VC backend   | command into the *pel-vc-log* buffer. The   | e events show the event as lisp lists.   |
| Toggle logging VC backend commands                                   | <f11> v 1</f11>  | (pel-vcs-toggle-vc-log)   | Start/stop logging VC commands in the *pel-vc-log* buffer.  • The command does not create the buffer; it is created on the first VC event.   |
| VC commands for Git • Git Reference                                  | Basic Git commands commands.   | s are well supported by Emacs VC mode.  | That works as long as Git is installed and the Emacs process has access to the git   |
| GIETIOIOIOIO   | <ul> <li>No special setup is required, VC will automatically detect that the file is inside a Git repository as described above.</li> <li>When editing a file that is inside a Git repository, you can use the following VC commands.</li> <li>Since the VC command key bindings is the same for all VCS backends, some of the commands do not apply to Git and are not listed below.</li> </ul> |   |  |
| • git commands:  | To add a file to a Git   | repo it must first be staged with the git ad  | d command. Then the changes must be committed with the git commit command.   |
| • git add<br>• git commit  | <ul> <li>The VC interface uses one command for the two operations. The vc-register performs a commit operation if the file is already staged, otherwi it only stages it.</li> <li>Inside the *vc-dir* buffer this command is mapped to the v key. That key will only operate on all marked files as long as the status of each of the marked file is the same.</li> </ul>                        |   |  |
| Add (stage) a file   | C-x v i  | (vc-register &optional VC-FILESET COMMENT)  | Register into a version control system: perform a <b>git add</b> for the file.   |
| Add/Commit current file  | C-x v v  | (vc-next-action VERBOSE)  | Executes, for the current file (or all marked files in the *vc-dir* buffer):  • git add of the files if the files are not part of the repository yet.  |
| Add/Commit selected file(s)  | v  |   | <ul> <li>git commit, of all marked files, otherwise.</li> <li>Refuses to perform the action when state of *vc-dir* selected items differ.</li> </ul>   |
| git blame command  |  | showing the revision id responsible for earlie useful for discovering when a change w         |  |
| Annotate version of each<br>line of file<br><u>git blame</u>         | С-х v g  | (vc-annotate FILE REV &optional<br>DISPLAY-MODE BUF MOVE-POINT-TO<br>VC-BK)                   | Annotate the lines of the current file: open a *Annotate file (rev #)* buffer that shows the annotation of each line of the current file, each changes has its own background colour.  • More commands are available in the *Annotate* buffer.   |
| Visit specified revision   | Print the specified fil  | es as they were at the given revision.  |  |
| Show the content of a<br>specific revision of a file<br>git cat-file | C-x v ~  | (vc-revision-other-window REV)  | Visit revision REV of the current file in another window. ⊌ Hit <b>tab</b> to list revisions.  • If the current file is named 'F', the revision is named 'F.~REV~'.  • If 'F.~REV~' already exists, use it instead of checking it out again.   |
| • git diff_command   | Show differences be  | tween revisions for the specified files.  |  |
| Diff versions of all files in directory:  git diff                   | C-x v D  | (vc-root-diff HISTORIC &optional NOT-URGENT)  | Executes: git diff command to list differences between all files in the local directory and the repository.  Display diffs between VC-controlled whole tree revisions.  Normally, this compares the tree corresponding to the current fileset with the working revision.  With a prefix argument HISTORIC, prompt for two revision designators specifying which revisions to compare.  The optional argument NOT-URGENT non-nil means it is ok to say no to saving the buffer. |
| Diff versions of current file:                                       | C-x v =  | (vc-diff &optional HISTORIC NOT-  | Executes: git diff command to list differences between current file version in repo  |
| git diff   | -  | ÜRGENT)   | <ul> <li>and local file's content.</li> <li>Display diffs between file revisions.</li> <li>Normally this compares the currently selected fileset with their working revisions. With a prefix argument HISTORIC, it reads two revision designators specifying which revisions to compare.</li> <li>The optional argument NOT-URGENT non-nil means it is ok to say no to saving the buffer.</li> </ul>   |
| Diff currently selected file(s)                                      | đ  | (log-view-diff BEG END)   | Show the file(s) difference(s) for the log entry inside a *vc-diff* buffer.  • Get the diff between two revisions.   |
| git diff   | D  | (log-view-diff-changeset BEG END)   | <ul> <li>If the region is inactive or the mark is on the revision at point, get the diff between the revision at point and its previous revision. Otherwise, get the diff between the revisions where the region starts and ends.</li> <li>Unlike 'log-view-diff-changeset', this function only shows the part of the changeset which affected the currently considered file(s).</li> </ul>  |
| Incoming changes   |  | ets found in the specified path/URL or the ongesets that would have been pulled by gi         | default pull location.<br>t pull at the time you issued this command.  |
| List files incoming from parent (or specified) repo                  | C-x v I  | (vc-log-incoming &optional REMOTE-LOCATION)   | List files incoming from parent (or specified) repo in the *vc-incoming* buffer.  • Show a log of changes that will be received with a pull operation from REMOTE-LOCATION.  • When called interactively with a prefix argument, prompt for REMOTE-LOCATION.   |
| • git log command  |  | tory of the specified files or the entire proje<br>ge-log* window buffer, using the vc-hg-log | ect. y-view-mode major mode which provides other commands. See section below.  |
| Print repo log works only when visiting a file git log               | C-x v L  | (vc-print-root-log &optional LIMIT)   | Executes: git log to list the repo log in a *vc-change-log* buffer.  List the change log for the current VC controlled tree in a window.  If LIMIT is non-nil, it should be a number specifying the maximum number of revisions to show; the default is 'vc-log-show-limit'.  When called interactively with a prefix argument, prompt for LIMIT.  |
| Open the change log for the file git log                             | C-x v 1  | (vc-print-log &optional WORKING-<br>REVISION LIMIT)   | Executes: git log. Open the change log for the file in the *vc-change-log* buffer.  • List the change log of the current fileset in a window.  |
| Show the change log for specific branch                              | в 1  | (vc-print-branch-log BRANCH)  | Show the change log for BRANCH in a *vc-change-log* window.  • Prompt for the branch name. Tab completion shows the list of changeset short ID numbers. It does not show them but you can also use the names of tags previously created with git tag.  • You can list the tags with the command git tag on the command line.   |
| Show history of file's region  | C-x v h  | (vc-region-history FROM TO)   | Show the history of the region between between point and mark.   |
| git merge command     git mergetool                                  | Merge another revision into working directory.   |   |  |
| Merge  | C-x v m  | (vc-merge)  | Executes: git merge. Perform a version control merge operation.  • You must be visiting a version controlled file, or in a 'vc-dir' buffer.  |
| git merge  |  |   | This runs a "merge" operation to incorporate changes from another branch onto the current branch, prompting for an argument list.  |
| Show outgoing  | Show changesets no   | ot found in the destination.  |  |
| Show change sets not found in the destination                        | C-x v O  | (vc-log-outgoing &optional REMOTE-<br>LOCATION)   | List deltas to push to parent repo.  Show a log of changes that will be sent with a push operation to REMOTE-LOCATION.  When called interactively with a prefix argument, prompt for REMOTE-LOCATION.  |
