rst-mode: reStructuredText Mode

<u>Description</u>	<u>Keystroke</u>	Function	<u>Note</u>	
<u>reStructuredText</u>			ated sometimes as 'rst' and sometimes as 're ST '). The rest is available in standard Emacs distribut.	ion.
 Help & customize rst-mode, syntax-control 	The reSructuredText files are supported by Emacs <u>rst-mode</u> from <u>rst.el</u> which is available in standard Emacs distribution. Supported file extensions: .rst, .rest, .stxt and .rst.txt. The .rst.txt extension allows rendering by tools supporting .txt files.			
compile/render file	☑ To activate it under PEL, you must set the PEL pel-use-rst-mode customization variable to t.			
text-filling, text emphasisitemize list of lines	pel-rst-tab-width: The width of a tab used for reStructuredText files. Defaults to 2.			
 Format reStucturedText table View/Navigate Table of Content 	 This concept differs from indentation: you can have an indentation of 3 and tab width of 8: M-i will move point to columns that are multiple of 8 <tab> will indent to a column that is a multiple of 3. PEL stores this value inside the tab-width user option variable for rst-mode buffers. See</tab> 			
Insert file header	∑ Indentation.			
Adorn Section LevelCreating/Using hyperlinks	Speedbar Support:	ether hard tabs are used for indentati	on. Defaults to nil (use space characters for all inden	tation).
 <u>Using goto-url-mode</u> <u>Copy URL target in file & visit it</u> 	PEL activates ∑ Speedt		n the pel-use-speedbar user-option is turned on (set	to t). Use the Speedbar to see the

Comment

<u>Description</u>	<u>Keystroke</u>	Function	Note	
Itemize all previous lines same indention level	• <f12> M • M-<f12> M</f12></f12>	(pel-itemize-lines &optional ITEM- PREFIX-STRING)	 Prepend each of the previous lines with a ITEM-PREFIX-STRING ("- " by default). Indents all lines above current line that are at the same indentation level. Use it to put a "- " prefix on each line instead of typing manually. Put point at empty line after list. Type the command to itemize all lines above. No need to mark. 	
Duplicate current table underlining This is not a perfect helper for creating restructured Toxt table but	• <f12> M-t • M-<f12> M-t</f12></f12>	(pel-rst-table-dup-separator- lines &optional UPDATE)	Duplicate the current table underlining separator, adding it to the top and the bottom of the table. This command helps you creating a <u>reStructuredText simple table layout</u> , assuming you have only 1 title row and point is at the written separator line. • With the C-u option updates the top and bottom line to the line at point.	
it helps creating simple ones.	Assuming you have the following text and point is on the second line (in blue)			
For example, to create the top and bottom line from the line under the	After executing the	======================================		
title:	command, the top and bottom lines are inserted. The point does not move.		2345	
File's Table of Content	 Use the <u>contents markup directive</u> to generate a table of contents for your reStructuredText file based on its sections. Insert the table of content text inside the file with the <u>rst-toc-insert</u> command (although you may want to use the <u>contents markup directive</u> instead). Generate a table of content in a buffer to view the file sections and navigate inside them: with C-c C-t C-t to invoke the <u>rst-doc</u> command: it opens a *table of Content* buffer, moves point inside it, move to the section title, hit <u>RET</u> to select that section inside the original reStructuredText buffer. 			
See also: <u>∑ Speedbar</u>		ppen a buffer that lists the sections. S		
Insert a table content at point Alternative: use the	C-c C-t TAB	(rst-toc-insert &optional MAX- LEVEL)	Insert the table of contents of the current section at the current column. • By default the top level is ignored if there is only one.	
contents markup directive			-max-level'. Text in the line beyond column is deleted.	
Display table of content	C-c C-t C-t	(rst-doc)	Display a table of contents for current buffer inside the *Table of Contents* buffer. • Displays all section titles found in the current buffer in a hierarchical list.	
Navigate to specific section			y navigating to it, then hit RET on that section to that section in the file.	
Moving across sections		g commands to move to the next or		
Move to previous section title	• C-M-a • <f12> p • <f12> <up></up></f12></f12>	(rst-backward-section OFFSET)	 Jump backward OFFSET section titles ending up at the start of the title line. OFFSET defaults to 1 and may be negative to move backward. An OFFSET of 0 does not move unless point is inside a title. Go to end or beginning of buffer if no more section titles in the desired direction. 	
	• <f11> SPC M-r p • <f11> SPC M-r <up></up></f11></f11>			
Move to next section title	• C-M-e • <f12> n</f12>	(rst-forward-section OFFSET)	Jump forward OFFSET section titles ending up at the start of the title line. • OFFSET defaults to 1 and may be negative to move backward. • An OFFSET of 0 does not may a unless point is inside a title.	
	• <f12> <down> • <f11> SPC M-r n • <f11> SPC M-r <down></down></f11></f11></down></f12>		 An OFFSET of 0 does not move unless point is inside a title. Go to end or beginning of buffer if no more section titles in the desired direction. 	
Mark complete current section	С-М-Һ	(rst-mark-section &optional COUNT ALLOW-EXTEND)	Select COUNT sections around point. • Mark following sections for positive COUNT or preceding sections for negative COUNT.	
Insert elements based on Tempo skeletons for reStructuredText	PEL provides support for flexible text template insertion through the Emacs built-in tempo skeleton mechanism. See also: Inserting Text • PEL creates key bindings to invoke the skeletons in the supported major modes, using the same key prefix sequence for each mode: <f12> <f12>, with the same key bindings for equivalent concepts (such as file header block) as much as possible. See also: Inserting Text for more info and information about tempo skeleton and yasnippet template-based text insertion).</f12></f12>			
∑ Customize PEL Text Insertions	<f6> <f2></f2></f6>	(pel-customize-pel &optional	Open the customization that control some of the features of the reStructuredText tempo	
control for reStructuredText skeletons.	<f12> <f12> <f2></f2></f12></f12>	OTHER-WINDOW) (pel-customize-generic-skels &optional OTHER-WINDOW)	skeletons text inserted by the skeleton text insertion commands for reStructuredText. • If OTHER-WINDOW is non-nil (use C-u), display in other window.	
Insert a file header	<f12> <f12> h</f12></f12>	(pel-rst-large-header)	Insert a large header includes all normal header fields plus separators.	
			nome page & license, markup for table of contents using the tempo skeleton mechanism. an move to the target points where extra text must be entered to complete the template.	
Toggle pel-tempo-mode	<f12> <f12> SPC</f12></f12>	(pel-tempo-mode &optional ARG)	Toggle pel-tempo-mode on/off. That mode activates key bindings to move to predefined hot-spots where template text must be added.	
See also: <u>▼ Mode Line</u>	The keys are: C-c . and. C-c , as well as (in graphics mode only): C-c C and C-c C-, When pel-tempo-mode is active the pel-tempo-mode lighter (‡) is shown on the status bar. When a skeleton is inserted via the execution of one of the pel-rst commands, the pel-tempo-mode is automatically activated.			
Jump to next tempo mark	• C-c M-f • C-c . • C-c C	(tempo-forward-mark)	Jump to the next mark in 'tempo-back-mark-list': the location where code must be updated inside the inserted skeleton. • These key key bindings are only available when pel-tempo-mode is active.	
Jump to previous tempo mark	• C-c M-b • C-c , • C-c C-,	(tempo-backward-mark)	Jump to the previous mark in 'tempo-back-mark-list': the location where code must be updated inside the inserted skeleton. • These key binding are only available when pel-tempo-mode is active.	
Tempo Template Tag Insertion	<pre><f12> <f12> <f12> <f12> <f12></f12></f12></f12></f12></f12></pre> <pre>(tempo-complete-tag &optional SILENT)</pre> <pre>Look for a tag and expand it.</pre>		Look for a tag and expand it.	
	Instead of using the <f12> <f12> key bindings above, you can type the template name (shown in the title column like "if", "case", etc) completely or partially and then hit <f12> <f12> <f12>. A completion buffer opens up if the template name is incomplete (or empty in which case the buffer lists all available template names). Select the template name and hit RET. Emacs expands the template. • All the tags in the tag lists in 'tempo-local-tags' (this includes 'tempo-tags') are searched for a match for the text before the point. The way the string to match for is determined can be altered with the variable 'tempo-match-finder'. If 'tempo-match-finder' returns nil, then the results are the same as no match at all. • If a single match is found, the corresponding template is expanded in place of the matching string. • If a partial completion or no match at all is found, and SILENT is non-nil, the function will give a signal. • If a partial completion is found and 'tempo-show-completion-buffer' is non-nil, a buffer containing possible completions is displayed. • Since, at the moment, only one template is available in rst-mode, the usefulness of this command is limited for reStructuredText.</f12></f12></f12></f12></f12>			
Select Section Title Adornment Styles	The underlying character used for section line adornment is customizable. The number of available levels and whether the line is indented, has a line over and under the title line is selected by the adornment style. PEL supports 3 styles. The following commands can be used to select a style.			
Select default adornment style	<f12> A d <f11> SPC M-r A d</f11></f12>	(pel-rst-adorn-default)	Set the default section adornment style. This is Emacs rst-mode default: a title with 7 levels.	
Select Sphinx-Python adornment style	<f12> A S <f11> SPC M-r A S</f11></f12>	(pel-rst-adorn-Sphinx-Python)	Set the Sphinx-Python section adornment style. This is what Sphinx supports: 6 levels: • parts, • chapters, • sections, • subsections, • subsubsections, • paragraphs.	
Select CRiSPer adornment style	<f12> A C <f11> SPC M-r A C</f11></f12>	(pel-rst-adorn-CRiSPer)	Set the CRiSPer section adornment style. A title level with another 12 levels. Use <f12> + to create those levels.</f12>	
	1			

<u>Description</u>	<u>Keystroke</u>	Function	Note
Section Title level	The rst.el library provides the	e rst-adjust command to create section	on adornment of the current line.
adornment			sometimes fails when market is used and not expected by its code. key bindings to adorn the current line to a fixed section level:
 commands that insert section titles 	title level and up to 10 c	other levels, from 1 to 9 and then 0 for	r 10.
	It also provides commands to adorn a line to the same level as the previous section or a lower or higher level. And then to increase or decrease the section level of the adornment of the current line. Pollow interest in address the section of the current line. Pollow interest in address the section level of the section address the sec		
	 PEL provides 3 style of section adornments: default, Sphinx-Python and CRiSPer, which can be selected with commands. PEL remembers the preferred style inside the customizable variable: pel-rst-adornment-style. The rest.el provides the rst-preferred-adornment user option to select the adornment characters for the various sections. PEL code selects the value according to the adornment style you select. 		
	See section "Select Add		e you select.
Adjust section level	• C-= • C-c C-=	(rst-adjust PFXARG)	Auto-adjust the adornment around point. • Adjust/rotate the section adornment for the section title around point or promote/
	• C-c C-a C-a		demote the adornments inside the region, depending on whether the region is active. This function is meant to be invoked possibly multiple times, and can vary its behavior
			with a positive PFXARG (toggle style), or with a negative PFXARG (alternate behavior). • This function is a bit of a swiss knife. It is meant to adjust the adornments of a section
			title in reStructuredText. It tries to deal with all the possible cases gracefully and to do "the right thing" in all cases.
Adorn line at title level	<f12> t</f12>	(pel-rst-adorn-title)	Adorn current line with level-0 (title) reStructuredText section adornment.
	<f11> SPC M-r t</f11>		If done at the top of the file, the first adorn line is placed on the first line of the file, a mark is left at the end of the title line and point is moved 2 lines below.
			To return to the end of the title line, type M- or <f6><f6>.</f6></f6>
Adorn to specific level From level 1 to level 10	• <f12> 1</f12>	(pel-rst-adorn-1)(pel-rst-adorn-2)	Adorn current line with level [1 to 10] reStructuredText section adornment.
	• <f12> 9 • <f12> 0</f12></f12>	• (pel-rst-adorn-3)	The <f11> SPC M-r 1 to <f11> SPC M-r 0 key sequences can be used inside any buffer. The <f12> keys can only be used in inside the buffers in rst-mode.</f12></f11></f11>
	• <f11> SPC M-r 1</f11>	(pel-rst-adorn-7)(pel-rst-adorn-8)	,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,
	 • <f11> SPC M-r 0</f11>	• (pel-rst-adorn-9) • (pel-rst-adorn-0)	
Adorn current line: same section	• <f12> =</f12>	(pel-rst-adorn-same-level)	Adorn current line with the same level as the previous section.
level as previous section	<f11> SPC M-r =</f11>		If the line is already adorned, update the adornment: adjust to previous section level.
Adorn to higher section level	<f12> +</f12>	(pel-rst-adorn-increase-level)	Adorn current line at a higher-level that current if already adorned.
	<f11> SPC M-r +</f11>		If the line is not already adorned, adorn it with a level higher than previous section.
Adorn to lower section level	<f12> -</f12>	(pel-rst-adorn-decrease-level)	Adorn current line at a lower-level than current if already adorned. • If the line not already adorned, adorn it with a level lower than previous section.
Refresh current line adornment	<f11> SPC M-r -</f11>	(nel-ret-adorn-refresh)	Refresh the adornment of the current line, adjusting the underlines to the current length
neirean current line adornment	<f12> r <f11> SPC M-r r</f11></f12>	(pel-rst-adorn-refresh)	Refresh the adornment of the current line, adjusting the underlining to the current length of the line. • This can be useful when changing the text on the line.
Creating and Using		nds help write hyperlink of various for	,
