Emacs support for Make Files

| | W | - | No. | | |
|--|--|---|---|--|--|
| Description | Keystroke Function Note • Emacs natively supports several Make dialect modes as listed below. | | | | |
| Make support | PEL adds several commands and user-options that add control to the editing behaviour. See: • pel-modes-activating-superword-mode: PEL automatically activates super-word-mode for make files. Use <f11> t <f2> to access the customization group</f2></f11> | | | | |
| Open this PDF file. See also: <u>∑ Help/</u> <u>Info</u> | <f11> SPC M <f1> <f12> <f1></f1></f12></f1></f11> | (pel-help-pdf &optional OPEN-WEB-PAGE) | Open the local copy of the <u>\$\mathbb{Y}_i\$ - Make</u> PDF file unless a command prefix (like C-u) was used. In that case it opens the Github-hosted file instead. | | |
| ұї - Make | <f11> SPC M <f3></f3></f11> | (pel-customize-library & optional OTHER-WINDOW) | Customize Emacs makefile support: makefile. • If OTHER-WINDOW is non-nil (use C-u), display in another window. | | |
| Select Make dialect mode See also: Customize | Emacs supports several dialects of make . It automatically selects the dialect when a file is visited using the mode and file specification association identified in the | | | | |

| Description | Keystroke | Function | <u>Note</u> | | |
|---|---|--|---|--|--|
| Insert macro defintion | = | (makefile-electric-equal ARG) | Prompt for name of a macro to insert. Only does prompting if point is at beginning of line. Anywhere else just self-inserts. | | |
| Insert special target | • | (makefile-electric-dot ARG) | Prompt for the name of a special target to insert. Supports tab completion. Only does electric insertion at beginning of line. Anywhere else just self-inserts. | | |
| Indenting | In make file editing, the tab character is important. The make program distinguish the tab character from multiple space characters. 1. The C-M-q key sequence is bound to prog-indent-sexp but it does not work well in makefile. Use the other 3 commands. | | | | |
| Insert a tab character | <tab></tab> | (indent-for-tab-command &optional ARG) | Inserts a tab character in a makefile. | | |
| Indent line(s) rigidly | • <f6> <tab> • <f11> <tab> c</tab></f11></tab></f6> | (pel-indent-lines &optional N) | Indent current or marked lines by N indentation levels. Each level uses a tab character. Works with point anywhere on the line. All lines touched by the region are indented. A special argument N can specify more than one indentation level. It defaults to 1. If a negative number is specified, 'pel-unindent-lines' is used. If a region is marked, the function does not deactivate it to allow repeated execution of the command. It also modifies the region to include all characters in all affected lines. Use C-g to de-activate the region. | | |
| Un-indent line(s) rigidly | <pre>• <backtab> • <f6> <backtab> • <f11> <tab> C</tab></f11></backtab></f6></backtab></pre> | (pel-unindent-lines &optional N) | Un-indent current line or marked lines by N indentation levels. Works with point is anywhere on the line. All lines touched by the region are un-indented. If region was marked, the function does not deactivate it to allow repeated execution of the command. If a region was marked, the function does not deactivate it to allow repeated execution of the command. It also modifies the region to include all characters in all affected lines Use C-g to de-activate the region. | | |
| Indent expression | С-М-q | (prog-indent-sexp &optional DEFUN) | Indent the expression after point. • When interactively called with prefix, indent the enclosing defun instead. A This command does not work well in makefiles. | | |
| Comment control | Although the make file modes provide the comment-region command, it's best to use comment-dwim as it works much better. | | | | |
| Comment/un- comment See also:∑ Comments | M-; | (comment-dwim ARG) | Comment or un-comment line or region. When no marked region and no comment: On empty line: insert comment starter at the proper indentation level. Typed again: move it toward end of line. On line with code: insert comment starter after the code for an end-of-line comment With marked un-commented region: Comment region (each line is commented) With marked commented region: removes the comment. Call the comment command you want (Do What I Mean). If the region is active and 'transient-mark-mode' is on, call 'comment-region' (unless it only consists of comments, in which case it calls 'uncomment-region'). Else, if the current line is empty, call 'comment-insert-comment-function' if it is defined, otherwise insert a comment and indent it. Else if a prefix ARG is specified, call 'comment-kill'. | | |
| | C-c C-c | (comment-region BEG END &optional ARG) | Comment or uncomment each line in the region. With just C-u prefix arg, uncomment each line in region BEG END. Numeric prefix ARG means use ARG comment characters. If ARG is negative, delete that many comment characters instead. The strings used as comment starts are built from 'comment-start' and 'comment-padding'; the strings used as comment ends are built from 'comment-end' and 'comment-padding'. By default, the 'comment-start' markers are inserted at the current indentation of the region, and comments are terminated on each line (even for syntaxes in which newline does not end the comment and blank lines do not get comments). This can be changed with 'comment-style'. Prefer comment-dwim: it works better. | | |
| Analyze | The following commands analyze the content of the make file or the file system. | | | | |
| Scan current directory files, checking for targets | C-c C-f | (makefile-pickup-filenames-as-targets) | Scan the current directory for filenames to use as targets. • Checks each filename against 'makefile-ignored-files-in-pickup-regex' and adds all qualifying names to the list of known targets. | | |
| Scan current buffer for makefile content | С-с С-р | (makefile-pickup-everything ARG) | Notice names of all macros and targets in Makefile. • Prefix arg means force pickups to be redone. Use this to refresh the list of macros and targets located in the makefile before executing another action on those. | | |
| Update scan with latest makefile buffer content | C-c C-u | (makefile-create-up-to-date-overview) | Create a buffer containing an overview of the state of all known targets. • Known targets are targets that are explicitly defined in that makefile; in other words, all targets that appear on the left hand side of a dependency in the makefile. | | |
| List macros and targets in dedicated buffer | C-c C-b | (makefile-switch-to-browser) | Open a *Macros and Target* buffer that only lists them. It operates in Fundamental mode and aside listing the macros and targets provides nothing more. | | |
