Customizing Emacs with PEL

<u>Operation</u>	<u>Keystroke</u>	Function	Note
PEL: Control Emacs		oing quickly with Emacs. Instead of	of having to write Emacs Lisp code, you use Emacs easy-to-use customization
via Easy	system. This table shows how to quickly gain access to the customized data using commands that open buffers that show the customized data inside buffers that operate in the Customize mode with special key bindings to speed up operation in that mode. • The first section shows navigation commands available inside a buffer that shows customized data (also called user options). • The later sections show commands that you can use to open buffers in Customization Mode to manage user options of interest. PEL - Configuration through Customization • PEL provides a growing set of customization groups and user option variables that control several aspects of Emacs: • The "pel-use-" activation user options identify what built-in or external Emacs Lisp package to use. PEL has logic to autoload the packages only when you need them. This way your Emacs will start quickly even if you have identified a large number of packages. • Once a package or feature is activated with the "pel-use-" user option, the other options control different behaviour of the activated package Once you have modified the configuration, execute M-x pel-init. PEL will activate the new configuration.

<u>Operation</u>	<u>Keystroke</u>	Function	<u>Note</u>
Browse PEL customize data	<f11> <f2> P B</f2></f11>	(pel-customize-browse)	Open the customize tree bowser for the entire PEL customization data (which
tree	<f12> P B</f12>		is under Emacs/Convenience.
Emacs Easy Customization	With the following command you can gain access to the Customize-mode to customize anything of interest. With the first command you open the customization buffer and then you can search or browse what you want to customize. The second command allow you to open the buffer at a specific customization group and the third one at a specific user option. These commands prompt for the information you are looking for. You can always use completion by typing <tab> at any point to get a list of available groups or variables. Several of the commands below open the PEL customization group and one or several other groups related to the same topic, when these groups are already loaded. If you set the OTHER-WINDOW argument, the command open s the buffer in another window and also open any group related that exists. For example if you open the PEL group for grep with C-u <f11> <f2> g, this will also open the grep group, the rg and ripgrep groups if they are loaded. Each group will open inside its own bugger and the command will create the necessary windows.</f2></f11></tab>		
	group, first load the package vi • Vote however that the PEL of	a one of its command that is auto-l commands that open customization load the related library to enable ac	own to Emacs and no buffer will be opened for it. To see the customization loaded or load it explicitly. In groups attempt to identify the library where the customization group is excess to the customization group. The groups accessible via the PEL
Customize Emacs	<f11> <f2> c</f2></f11>	(customize)	Select a customization buffer which you can use to set user options. User options are structured into "groups". Initially the top-level group 'Emacs' and its immediate subgroups are shown; the contents of those subgroups are initially hidden.
			⚠ Emacs is only able to show information it knows about. Customization data defined in files not loaded will not be accessible.
Customize a specific group	<f11> <f2> g</f2></f11>	(customize-group &optional GROUP OTHER-WINDOW)	Customize GROUP, which must be a customization group. If OTHER-WINDOW is non-nil (use C-u), display in another window. This command provides completion and you can use it to detect groups. Emacs is only able to show the name names of groups that are defined in files that have already been loaded. You won't be able to open a group that
	<f12> g</f12>		is not already loaded. • The pel-customize-library commands available as the <f3> key of PEL key prefixes does not suffer from this problem: it will detect that the library is not loaded and will prompt you for loading it, giving you access to the customization buffer when you need it. The information is available in the various PDF pages at the top of each page.</f3>
Customize a user option	<f11> <f2> o</f2></f11>	(customize-option SYMBOL)	Customize SYMBOL, which must be a user option. As with groups, Emacs provides completion for user options, allowing you to detect user options.
	<f12> o</f12>		⚠ Emacs is only able to show the name names of user options that are defined in files that have already been loaded. You won't be able to open a group that is not already loaded. But see the notice in the above cell.
Set and store new value for user-option	<f11> <f2> v</f2></f11>	(customize-save-variable VARIABLE VALUE &optional COMMENT)	Set the default for VARIABLE to VALUE, and save it for future sessions in the customize file. Prompts for the user-option name, supporting tab completion. Propose values controlled by customization selections.
	<f12> v</f12>		 As opposed to the commands above this does not open a customization buffer. Use this to quickly change a PEL pel-use- user-option if you know its documentation and do not want to open a customization buffer.
Activate and cleanup your packages using PEL customization user- variables	PEL provides customization-driven package management. PEL controls download, installation and configuration of the packages supported by its pel-use- user-options controlled by the PEL customization groups. The packages missing are installed when you start Emacs or when you explicitly run the pel-init command. PEL also removes the packages that are not required by the PEL user-options when you issue the pel-cleanup command. Use a key prefix for this command to perform a dry-run of the command and produce a report of what would be removed. PEL does not delete packages. Instead it places them into separate directories, called "attic" directories. You can then retrieve the package from the directories later.		
	 The elpa packages are stored in the directory identified by package-user-dir or in the "elpa" directory inside the user-emacs-directory. The elpa attic is identified by a name that appends "-attic" to the above directory name. On a Unix-like system that would normally be "~/.emacs.d/elpa" and "~/.emacs.d/elpa-attic". The non-elpa files are stored in the directory identified by the pel-utils-dirname user-options (which defaults to "utils") inside the directory identified by the user-emacs-directory. Its attic directory name is the same name with a "-attic" suffix. By default, on Unix-like systems the directories are "~/.emacs.d/utils" and "~/.emacs.d/utils-attic". On Windows system the directories are located in your User directory, as controlled by Emacs. Also on Emacs 27.1 and later these directories can be located somewhere else. The customization file (described in a section above) should be located in the same user-emacs-directory. 		
Re-initialize PEL, activate the new PEL user-option, install packages newly requested	M-x pel-init	(pel-init &optional CACHED-ABBREV-FILE-NAME)	Re-initialize PEL. Download, install and configure any package requested by the various pel-use - user-options that have not yet been installed. Does not remove anything. Use pel-cleanup for that. The argument is not accessible interactively and exists for the initial Emacs startup only.
Show PEL user option and package info	<f11> ? e ?</f11>	(pel-package-info &optional FULL-REPORT)	Display the following information in the echo area: • The number of PEL user-options, and the number of them that are active.
See also: <u>∑ Help/Info</u>			 The number of Elpa packages active: the count of the ones directly installed because of active PEL user-options and the count of them installed as dependencies of the first group. The number of Emacs Lisp files stored in the ~/.emacs.d/utils (or equivalent directory) as a result of PEL user options. With optional argument, generates a full report with much more details in a *pel-user-options* report buffer. Any key prefix works. M <f11>?</f11> e ? for example.
Disable all packages not requested by PEL user-options and not identified as dependency or packages that must be kept.	M-x pel-cleanup	(pel-cleanup &optional DRY-RUN)	After prompting for a confirmation, de-activates all Elpa and non-Elpa packages that are not requested by a PEL user-option. The command keeps packages that are dependencies of packages required by PEL user-options and packages that PEL always requires. It also keeps packages that you have identified as manually installed in the following user options: • pel-elpa-packages-to-keep
Update the load path and the customization file content.			• pel-utils-packages-to-keep A For the current version of PEL when you install an Emacs package with the Emacs package system, PEL does not automatically add the package name in the pel-elpa-packages-to-keep user-option. If you want to keep that package and configure it yourself with your own Emacs Lisp code invoked by your init.el file, add the package symbol name to the list of pel-elpa-packages-to-keep otherwise pel-cleanup will move the package to the elpa-attic.
Perform a dry-run of pel- cleanup. Generate a detailed report.	M M-x pel-cleanup		Runs pel-cleanup in dry-mode and produce a detailed report of what pel-pel-cleanup would remove in a *pel-cleanup* buffer.

	<f12> <f3></f3></f12>	If OTHER-WINDOW is non-nil (use c-u), display in another window.		
Configure PEL Markup support	The following commands opens the Emacs customization group related to configure Emacs support for the specific markup language. The <f11> SPC key prefixes are available globally (for all buffers). The <f12> <f3> key is only available when point is in a buffer for one of the languages supported by PEL and open the Emacs customization group for the markup language for the current buffer. When you use the <f11> SPC prefix, you can customize the Emacs language library support that might not even be loaded: PEL will detect if the corresponding library is loaded and will prompt you asking if you want to load it first, allowing Emacs to open the customization buffer.</f11></f3></f12></f11>			
		ustomize Emacs Graphviz-Dot support.		
	<f12> <f3></f3></f12>	If OTHER-WINDOW is non-nil (u	se C-u), display in another window.	
M PlantUML	• <f11> D u <f3> • <f11> SPC M-u <f3></f3></f11></f3></f11>	Customize Emacs PlantUML support. • If OTHER-WINDOW is non-nil (use C-u), display in another window.
