

Description	<u>Key</u>	Function	<u>Note</u>
<u>Smartparens</u>			irs and tries to be smart about it" as per its author. It has features comparable to Lispy but supports
Smartparens manual	multiple programming languages and text formats.  The smartparens external package like is activated by PEL downloads via the pel-use-smartparens user-option. Use <f11> ( <f2> to access.</f2></f11>		
<u></u>	Access smartparent	s custom buffer with <f11> (</f11>	<f3></f3>
Open this PDF file. See also: <u>File Help/Info</u>	<f11> ( <f1></f1></f11>	(pel-help-pdf &optional OPEN-WEB-PAGE)	Open the <u>EX Smartparens</u> local PDF. If the prefix argument (like <b>C-u</b> or <b>M</b> ) is used, then it opens the remote GitHub hosted raw PDF instead. If the <b>pel-flip-help-pdf-arg</b> user-option is set it's the other way around.
∑ Customize PEL smart parens control	<f11> ( <f2></f2></f11>	(pel-customize-pel &optional OTHER-WINDOW)	Customize PEL text insertion support: rainbow-delimiters, smartparens.  • If OTHER-WINDOW is non-nil (use C-u), display in other window.
∑ Customize Emacs smart parens control	<f11> ( <f3></f3></f11>	(pel-customize-library &optional OTHER-WINDOW)	Customize Emacs text insertion support: rainbow-delimiters, <b>smartparens.</b> If OTHER-WINDOW is non-nil (use <b>C-u</b> ), display in other window.
Smartparens Mode Smartparens manual			ns minor mode. PEL binds a set of keys, described below, to toggle activation of that mode. PEL activates it when pel-use-smartparens is set to t.
See also:  ∑ Inserting Text	Smartparents er	nhances the behaviour of certain	keys, namely those that are part of any pair or tag. martparens-strict-mode: SP/s
Help on smartparens	<f11> ( ?</f11>	( <b>sp-cheat-sheet</b> & optional ARG)	Generate a cheat sheet of all the smartparens interactive functions. Shows inside Emacs buffer.  • Print only the short documentation and examples.  • With non-nil prefix argument ARG (C-u), show the full documentation for each function.  • You can follow the links to the function or variable help page.  • To get back to the full list, use M-x help-go-back.  • You can use 'beginning-of-defun' and 'end-of-defun' to jump to the previous/next entry.  • Examples are fontified using the 'font-lock-string-face' for better orientation.
Describe user system	<f11> ( M-?</f11>	(sp-describe-system STARTERKIT)	Describe user's system. Prompt for starter kit: Evil, Spacemac, Vanilla.  • The output of this function can be used in bug reports.
Print smartparens info	<f11> ( i</f11>	(pel-smartparens-info)	Print smartparens setup info in *pel-smartparens-info* buffer.  • The information printed includes values of several variables organized by sections. Sections and variable names are clickable buttons. Sections lead to relevant smartparens pages, while variables buttons open help for the variable.
Toggle smartparens mode	<f11> ( (</f11>	(smartparens-mode &optional ARG)	Toggle smartparens mode.
Toggle smartparens- strict mode	<f11> ( )</f11>	(smartparens-strict-mode &optional ARG)	Toggle the strict smartparens mode.  • When strict mode is active, 'delete-char', 'kill-word' and their backward variants will skip over the pair delimiters in order to keep the structure always valid (the same way as 'paredit-mode' does). This is accomplished by remapping them to 'sp-delete-char' and 'sp-kill-word'. There is also function 'sp-kill-symbol' that deletes symbols instead of words, otherwise working exactly the same (it is not bound to any key by default).  • When strict mode is active, this is indicated with "/s" after the smartparens indicator in the mode list
Toggle smartparens mode	<f11> ( M-(</f11>	(smartparens-global-mode &optional ARG)	Toggle Smartparens mode in all buffers.  • With prefix ARG, enable Smartparens-Global mode if ARG is positive; otherwise, disable it.  • Smartparens mode is enabled in all buffers except this identified in sp-ignore-mode-list.
Toggle smartparens- strict mode	<f11> ( M-)</f11>	(smartparens-global-strict-mode &optional ARG)	Toggle Smartparens-Strict mode in all buffers.  • With prefix ARG, enable Smartparens-Global-Strict mode if ARG is positive; otherwise, disable it.  • Smartparens-Strict mode is enabled in all buffers where 'turn-on-smartparens-strict-mode' would do it.
Narrowing	See <u>Narrowing</u> for m	ore information on narrowing.	
Narrow to sexp	M- <f7> M-n</f7>	(sp-narrow-to-sexp ARG)	Make text outside current balanced expression invisible.  • A numeric arg specifies to move up by that many enclosing expressions.  • See also 'narrow-to-region' and 'narrow-to-defun'.
<u>Navigation</u>	PEL provides bindings for all smartparens navigation commands using the M- <f7> prefix.  • PEL also provides 10 bindings using the C-M- modifiers combination for the main navigation commands. 6 of them correspond to the recommended navigation key bindings, the other 4 differ to allow valid bindings when Emacs runs in terminal mode and better reflect standard bindings. The changes are:  • sp-backward-down-sexp (&amp;optional arg) ;; C-M-a&gt; C-M-z  • sp-up-sexp (&amp;optional arg) ;; C-M-e&gt; C-M-]  • sp-beginning-of-sexp (&amp;optional arg) ;; C-S-d&gt; C-M-a  • sp-end-of-sexp (&amp;optional arg) ;; C-S-d&gt; C-M-e  • The smartparens package does not bind any key by default. However, the recommended bindings are shown in blue as if they were. PEL binds them.  • For bindings that differ from the recommended ones, the recommended binding is shown in crossed out red. PEL doe not activate these bindings.</f7>		
To end of next element/	• M- <f7> f • C-M-f</f7>	( <b>sp-forward-sexp</b> &optional ARG)	Move forward across one balanced expression.  • With ARG, do it that many times.
forward  Behaves as lispy j when point after end parens	V C-M-1	Tuto,	A negative argument N means move backward across N balanced expressions.  If there is no forward expression, jump out of the current one (effectively doing 'sp-up-sexp').  With 'sp-navigate-consider-symbols' symbols and strings are also considered balanced expressions.
			(foo bar baz) -> (foo bar baz)
			( foo bar baz) -> (foo  bar baz)
			( foo bar baz) -> (foo bar  baz) ;; 2
To beginning of	• M- <f7> b</f7>	(sp-backward-sexp &optional	(foo (bar baz )) -> (foo (bar baz) )  Move point backward to beginning of previous block element.
previous element/block backward	• C-M-b	ARG)	<ul> <li>With ARG, do it that many times.</li> <li>A negative argument N means move forward across N balanced expressions.</li> <li>If there is no previous expression, jump out of the current one (effectively doing 'sp-backward-up-sexp'): moves out of block, then previous block.</li> <li>With 'sp-navigate-consider-symbols' symbols and strings are also considered balanced expressions.</li> </ul>
			(foo bar baz)   ->  (foo bar baz)
			(foo  bar baz) -> ( foo bar baz)
			(foo bar  baz) -> ( foo bar baz) ;; 2
			(( foo bar) baz) -> ( (foo bar) baz)

Description	<u>Key</u>	Function	<u>Note</u>
To beginning of next	• M- <f7> n</f7>	(sp-next-sexp &optional ARG)	Move forward to beginning of next block element. At end of block move to beginning of outer
element/block • forward/backward	• C-M-n		<ul> <li>block.</li> <li>With ARG, do it that many times.</li> <li>If there is no next expression at current level, jump one level up (effectively doing 'sp-backward-up-sexp').</li> <li>A negative argument N means move to the beginning of N-th previous balanced expression.</li> <li>If 'sp-navigate-interactive-always-progress-point' is non-nil, and this is called interactively, the point will move to the first expression in forward direction where it will end up greater than the current location.</li> <li>With 'sp-navigate-consider-symbols' symbols and strings are also considered balanced expressions.</li> </ul>
			((foo)  bar (baz quux)) -> ((foo) bar  (baz quux))
			((foo) bar  (baz quux)) ->  ((foo) bar  (baz quux))
			With non-nil 'sp-navigate-interactive-always-progress-point'
			(floo bar) -> (foo lbar)
			((fo o) (bar)) -> ((foo)  (bar))
To end of previous element  • backward	• M- <f7> p • C-M-p</f7>	(sp-previous-sexp &optional ARG)	Move backward to end of previous block element.  With ARG, do it that many times. If there is no next expression at current level, jump one level up (effectively doing 'sp-up-sexp').  A negative argument N means move to the end of N-th following balanced expression.  With 'sp-navigate-consider-symbols' symbols and strings are also considered balanced expressions.  If 'sp-navigate-interactive-always-progress-point' is non-nil, and this is called interactively, the point will move to the first expression in backward direction where it will end up less than the
			current location.
			((foo) bar  (baz quux)) -> ((foo)  bar (baz quux))
			((foo)  bar (baz quux)) -> ((foo) bar (baz quux))
			If 'sp-navigate-interactive-always-progress-point' is non-nil:
			(foo b ar baz) -> (foo  bar baz)
		(on forested possible costs	(foo (b ar baz)) -> (foo  (bar baz))
• forward	M- <f7> F</f7>	(sp-forward-parallel-sexp &optional ARG)	<ul> <li>Move forward across one balanced expressions at the same depth.</li> <li>If calling 'sp-forward-sexp' at point would result in raising a level up, loop back to the first expression at current level, that is the first child of the enclosing sexp as defined by 'sp-get-enclosing-sexp'.</li> </ul>
backward	M- <f7> B</f7>	( <b>sp-backward-parallel-sexp</b> &optional ARG)	Move backward across one balanced expressions at the same depth.  • If calling 'sp-backward-sexp' at point would result in raising a level up, loop back to the last expression at current level, that is the last child of the enclosing sexp as defined by 'sp-get-enclosing-sexp'.
Into block forward • forward	• M- <f7> d • C-M-d</f7>	( <b>sp-down-sexp</b> &optional ARG)	Move forward to the beginning of inner element of a block.  With ARG, do this that many times.  A negative argument N means move backward but still go down a level.  If ARG is raw prefix argument C-u, descend forward as much as possible.  If ARG is raw prefix argument C-u C-u, jump to the beginning of current list.  If the point is inside sexp and there is no down expression to descend to, jump to the beginning of current one. If moving backwards, jump to end of current one.
			foo (bar (baz quux)) -> foo ( bar (baz quux))

			(foo (abc)  bar) -> (foo   bar)
			blab (foo (bar baz) quux)  -> blab
			(1 2 3  4 5 6) -> ( 4 5 6) ;; C-u
Kill element after	M- <f7> - }</f7>	(sp-kill-hybrid-sexp ARG)	Kill a line as if with 'kill-line', but respecting delimiters.
current		0 1	-u C-u, kill the hybrid sexp the point is in (see 'sp-get-hybrid-sexp').
,		<ul><li>With ARG numeric prefix 0 (z</li><li>You can customize the behave</li></ul>	viour of this command by toggling 'sp-hybrid-kill-excessive-whitespace'.
		foo   bar baz	-> foo   ;; nil
		foo (bar   baz) quux	-> foo (bar  ) quux
		foo   bar (baz	-> foo   ;; nil
		quux) foo "bar  baz quux" q	uack -> foo "bar  " quack ;; nil
		foo (bar baz) qu <mark> </mark> ux (quac zaq)	hoo
		foo   (bar baz)	-> foo   ;; C-0 baz)
Kill whole line	M- <f7> - 1</f7>	(sp-kill-whole-line)	<ul> <li>Kill current line in sexp-aware manner.</li> <li>First, go to the beginning of current line and then try to kill as much as possible on the current line but without breaking balance.</li> <li>If there is a hanging sexp at the end of line the it is killed as well.</li> <li>If there is a closing delimiter for a sexp "up" current sexp, the kill is not extended after it. For more details see 'sp-kill-hybrid-sexp'.</li> <li>(progn (progn (some long sexp)) -&gt;   )</li> </ul>
Kill/splice			
Un-wrap current block,	M- <f7> 1 1</f7>	(sp-splice-sexp &optional	Un-wrap current block, splicing its content in enclosing block (if any).
splicing its elements in enclosing block		ARG)	(foo (bar baz) quux) -> (foo bar baz quux)
			(foo  (bar baz) quux) -> foo  (bar baz) quux
			(foo (bar baz) quux) -> foo (bar baz) quux ;; 2
Kill block element(s)	M- <f7> 1 [</f7>	(sp-splice-sexp-killing-	Note that to kill only the content and not the enclosing delimiters you can use C-u M-x sp-
before point and splice remaining into outer block	C-M- <backspace></backspace>	backward &optional ARG)	backward-kill-sexp.  • See 'sp-backward-kill-sexp' for more information.
			(foo (let ((x 5))  (sqrt n)) bar) -> (foo  (sqrt n) bar)
			<pre>_ (when ok </pre>
			<pre>_ (save-excursion</pre>
Kill block element(s)	M- <f7> 1 ]</f7>	(sp-splice-sexp-killing-	Note that to kill only the content and not the enclosing delimiters you can use C-u M-x sp-kill-sexp.
forward and splice remaining into outer	C-M- <delete></delete>	forward &optional ARG)	See 'sp-kill-sexp' for more information.
block			(a (b c  d e) f) -> (a b c  f) (+ (x   y z) w) -> (+ x  w)
Kill around element	M- <f7> 1 o</f7>	(sp-splice-sexp-killing-	
	C-S- <backspace></backspace>	around &optional ARG)	(a b   (c d) e f) ->   (c d) ;; with arg = 1
			(a b   c d e f) ->   c d ;; with arg = 2
			(-(car x)   a 3) -> $(car x)  $ ;; with arg = -1
			(foo (bar  baz) quux) ->  (bar baz) ;; with arg = C-u C-u

Description	<u>Key</u>	Function	<u>Note</u>
<ul> <li>Delete/Kill region</li> </ul>			as the deletion would not create unbalanced blocks. eleting text in area where several balanced and nested blocks are present.
Delete region	M- <f7> DEL -</f7>	(sp-delete-region BEG END)	Delete the text between point and mark, like 'delete-region'.  BEG and END are the bounds of region to be deleted.  If that text is unbalanced, signal an error instead.  With a prefix argument, skip the balance check.
Kill region	M- <f7></f7>	(sp-kill-region BEG END)	Kill the text between point and mark, like 'kill-region'.  BEG and END are the bounds of region to be killed.  If that text is unbalanced, signal an error instead.  With a prefix argument, skip the balance check.
Delete char			es that delete forward and backward without breaking blocks. when smartparens-mode is active.
Delete char forward	M- <f7> DEL n</f7>	( <b>sp-delete-char</b> & optional ARG)	Delete a character forward or move forward over a delimiter.  If on an opening delimiter, move forward into balanced expression.  If on a closing delimiter, refuse to delete unless the balanced expression is empty, in which case delete the entire expression.  If the delimiter does not form a balanced expression, it will be deleted normally.  With a numeric prefix argument N > 0, delete N characters forward.  With a numeric prefix argument N < 0, delete N characters backward.  With a numeric prefix argument N = 0, simply delete a character forward, without regard for delimiter balancing.  If ARG is raw prefix argument C-u, delete characters forward until a closing delimiter whose deletion would break the proper pairing is hit.  (quu   x "zot") -> (quu   "zot")  (quux   "zot") -> (quux " zot") -> (quux " ot")  (foo ( ) bar) -> (foo   bar)    (foo bar) -> ( foo bar)
Delete char backward	M- <f7> DEL p</f7>	(sp-backward-delete-char &optional ARG)	Delete a character backward or move backward over a delimiter.  • It has the same description as the above command but goes backward instead of forward.  ("zot" q uux) -> ("zot"  uux)  ("zot" quux) -> ("zot   quux) -> ("zo   quux)  (foo ( ) bar) -> (foo   bar)  (foo bar   -> (foo bar  )
Delete/Kill word			(100 2017)
Delete word backward	M- <f7> DEL v</f7>	(sp-backward-delete-word &optional ARG)	(sp-backward-delete-word &optional ARG)  • Delete a word backward, skipping over intervening delimiters.  • Deleted word does not go to the clipboard or kill ring.  • With ARG being positive number N, repeat that many times.  • With ARG being Negative number -N, repeat that many times in backward direction.
Delete word forward	M- <f7> DEL W</f7>	( <b>sp-delete-word</b> &optional ARG)	Delete a word forward, skipping over intervening delimiters.  Deleted word does not go to the clipboard or kill ring.  With ARG being positive number N, repeat that many times.  With ARG being Negative number -N, repeat that many times in backward direction.
Kill word backward	M- <f7> - v</f7>	(sp-backward-kill-word &optional ARG)	<ul> <li>Kill a word backward, skipping over intervening delimiters.</li> <li>With ARG being positive number N, repeat that many times.</li> <li>With ARG being Negative number -N, repeat that many times in backward direction.</li> </ul>
Kill word forward	M- <f7> - w</f7>	(sp-kill-word &optional ARG)	Kill a word forward, skipping over intervening delimiters.  With ARG being positive number N, repeat that many times.  With ARG being Negative number -N, repeat that many times in backward direction.
<ul> <li>Delete/Kill symbol</li> </ul>	See 'sp-backward-syn	nbol' and 'sp-forward-symbol'	for what constitutes a symbol for the backward and forward commands respectively.
Delete symbol backward	M- <f7> DEL a</f7>	(sp-backward-delete- symbol &optional ARG WORD)	Delete a symbol backward, skipping over any intervening delimiters.  Deleted symbol does not go to the clipboard or kill ring.  With ARG being positive number N, repeat that many times.  With ARG being Negative number -N, repeat that many times in forward direction.
Delete symbol forward	M- <f7> DEL s</f7>	( <b>sp-delete-symbol</b> & optional ARG WORD)	Delete a symbol forward, skipping over any intervening delimiters.  • Deleted symbol does not go to the clipboard or kill ring.  • With ARG being positive number N, repeat that many times.  • With ARG being Negative number -N, repeat that many times in backward direction.
Kill symbol backward	M- <f7> - a</f7>	(sp-backward-kill-symbol &optional ARG WORD)	Kill a symbol backward, skipping over any intervening delimiters.  With ARG being positive number N, repeat that many times.  With ARG being Negative number -N, repeat that many times in forward direction.
Kill symbol forward	M- <f7> - s</f7>	( <b>sp-kill-symbol</b> & optional ARG WORD)	Kill a symbol forward, skipping over any intervening delimiters.  With ARG being positive number N, repeat that many times.  With ARG being Negative number -N, repeat that many times in backward direction.
Mark			
Mark next	M- <f7> . n</f7>	(sp-select-next-thing &optional ARG POINT)	Set active region over next thing as recognized by 'sp-get-thing'.  If ARG is positive N, select N expressions forward.  If ARG is negative -N, select N expressions backward.  If ARG is a raw prefix C-u select all the things up until the end of current expression.  If ARG is a raw prefix C-u C-u select the current expression (as if doing 'sp-backward-up-sexp' followed by 'sp-select-next-thing').  If ARG is number 0 (zero), select all the things inside the current expression.  If POINT is non-nil, it is assumed it's a point inside the buffer from which the selection extends, either forward or backward, depending on the value of ARG.  If the currently active region contains a balanced expression, following invocation of 'sp-select-next-thing' will select the inside of this expression. Therefore calling this function twice with no active region will select the inside of the next expression.  If the point is right in front of the expression any potential prefix is ignored. For example, ' (foo) would only select (foo) and not include ' in the selection. If you wish to also select the prefix, you have to move the point backwards.  With 'sp-navigate-consider-symbols' symbols and strings are also considered balanced expressions.
Mark previous	M- <f7> . p</f7>	(sp-select-previous-thing &optional ARG POINT)	Set active region over ARG previous things as recognized by 'sp-get-thing'.  If ARG is negative -N, select that many expressions forward.  With 'sp-navigate-consider-symbols' symbols and strings are also considered balanced expressions.

Description	Key	Function	<u>Note</u>
Mark next and exchange	M- <f7> . N</f7>	(sp-select-next-thing- exchange &optional ARG POINT)	Just like 'sp-select-next-thing' but run 'exchange-point-and-mark' afterwards.
Mark previous and exchange	M- <f7> . P</f7>	(sp-select-previous-thing- exchange &optional ARG POINT	Just like 'sp-select-previous-thing' but run 'exchange-point-and-mark' afterwards.
Mark current block	M- <f7></f7>	(sp-mark-sexp &optional ARG ALLOW-EXTEND)	Set mark ARG balanced expressions from point.  The place mark goes is the same place M-x sp-forward-sexp would move to with the same argument.  Interactively, if this command is repeated or (in Transient Mark mode) if the mark is active, it marks the next ARG sexps after the ones already marked.  This command assumes point is not in a string or comment.
Indentation ##			
	<f11> p <tab> M-<f7> <tab></tab></f7></tab></f11>	(sp-indent-adjust-sexp)	Add the hybrid sexp at line into previous sexp. All forms between the two are also inserted.  • Specifically, if the point is on empty line, move the closing delimiter there, so the next typed text will become the last item of the previous sexp.  • This acts similarly to 'sp-add-to-previous-sexp' but with special handling of empty lines.
	M- <f7> S-<tab></tab></f7>	(sp-dedent-adjust-sexp)	Remove the hybrid sexp at line from previous sexp.  All sibling forms after it are also removed (not deleted, just placed outside of the enclosing list). Specifically, if the point is on empty line followed by closing delimiter of enclosing list, move the closing delimiter after the last item in the list.  This acts similarly to 'sp-forward-barf-sexp' but with special handling of empty lines.
Re-indent current defun		( <b>sp-indent-defun</b> &optional ARG)	Reindent the current defun.  • If point is inside a string or comment, fill the current paragraph instead, and with ARG, justify as
??in non lisp??		Andj	well.     Otherwise, reindent the current defun, and adjust the position of the point.
Validation ##			
		(sp-region-ok-p START END)	Test if region between START and END is balanced.  • A balanced region is one where all opening delimiters are matched by closing delimiters.  • This function does *not* check that the delimiters are correctly ordered, that is [(]) is considered correct even though it is not logically properly balanced.
		(sp-newline)	Insert a newline and indent it.  This is like 'newline-and-indent', but it not only indents the line that the point is on but also the S-expression following the point, if there is one.  If in a string, just insert a literal newline.  If in a comment and if followed by invalid structure, call 'indent-new-comment-line' to keep the invalid structure in a comment.
		(sp-comment)	Insert the comment character and adjust hanging sexps such that it doesn't break structure.
		(sp-wrap-round)	Wrap following sexp in round parentheses.
		(sp-wrap-square)	Wrap following sexp in square brackets.
		(sp-wrap-curly)	Wrap following sexp in curly braces.
Highlight ##			
		(sp-show-enclosing-pair)	Highlight the enclosing pair around point.
		(sp-highlight-current-sexp ARG)	Highlight the expression returned by the next command, preserving point position.
