Registers

negisters				
Description	Keystroke	Function	Note	
Emacs Registers		Emacs registers are compartments where you can say s commands, the PEL package adds a set of convenie	ve text, rectangles, positions, and other things for later use." ence functions.	
	A By default, Emacs does not save register content on exit; this information does not persist across Emacs sessions. However, there are several packages that implement project management that store/restore the registers (such as desktop.el)			
	Register names: • The registers (identified as <reg> in the table below) are identified by single character name. Even control codes.</reg>			
	Restriction: do not use '?' (as '?' is a prefix to identify characters in Elisp) nor Esc nor C-g for register name.			
	• All <f11> r commands</f11>	(pel- functions) check if the assignment to a register x r commands (native Emacs commands) do not pro	is attempting to use a register that already contain something, arovide this type of protection.	
Display register content				
View Register content	<f11> r v <reg></reg></f11>	(view-register REGISTER)	Opens a small temporary window showing what the specified register holds.	
List all Registers	<f11> r 1</f11>	(list-registers)	Opens a window that lists all register names and their content	
Record data in register:	Once information related to use the <f11> r j comma</f11>	point, keyboard-macro, window or frame is recorded	into a register,	
point, k eyboard-macro, w indow, f rame	use the CIII I J Comme	and to restore it.		
Copy point position in register <reg≥< td=""><td>• C-x r SPC <reg> • <f11> r p <reg></reg></f11></reg></td><td>(point-to-register REGISTER & optional ARG) (pel-point-to-register REGISTER & optional ARG)</td><td>Record the position of point and the current buffer in register r. With prefix argument store frame configuration.</td></reg≥<>	• C-x r SPC <reg> • <f11> r p <reg></reg></f11></reg>	(point-to-register REGISTER & optional ARG) (pel-point-to-register REGISTER & optional ARG)	Record the position of point and the current buffer in register r. With prefix argument store frame configuration.	
Save keyboard macro in register <reg></reg>	• C-x C-k x <reg> • <f11> r k <reg></reg></f11></reg>	(kmacro-to-register REGISTER) (pel-kmacro-to-register REGISTER)		
Save Window layout in register <reg></reg>	• C-x r w <reg> • <f11> r w <reg></reg></f11></reg>	(window-configuration-to-register REGISTER) (pel-window-configuration-to-register REGISTER)	See Preserve window layout in Emacs @ StackOverflow.	
"Jump" to register <reg>to: • move to point</reg>	• C-x r j <reg> • <f11> r j <reg></reg></f11></reg>	(jump-to-register REGISTER &optional DELETE)	Used to restore position, windows and frames (and execution keyboard-macros).	
execute keyboard-macro restore window layout restore frame layout			When restoring frames, any frame not included in the configuration become invisible. To delete these frames use: C-c-x r j R	
			See Emacs Manual section 13.4	
Record data in register:	Once information relate to a use the <f11></f11> r i com	file name, a number, a rectangle or text is recorded in	to a register,	
filename, n umber, r ectangle, t ext	use the CIII I I COM	imanu to restore mat data.		
Store the state of all frames and their windows in register <reg></reg>	• C-x r f <reg> • <f11> r f <reg></reg></f11></reg>	(frameset-to-register REGISTER) (pel-frameset-to-register REGISTER)	Store the state (position and sizes) of all frames and all their windows in register.	
Store file name in register <reg></reg>	<f11> r F <reg></reg></f11>	(pel-filename-to-register REGISTER)	Store the file name (with full path) of the file edited in current buffer in register.	
Store NUMBER into register <reg></reg>	• C-x r n <reg> • <f11> r n <reg></reg></f11></reg>	(number-to-register NUMBER REGISTER) (pel-number-to-register NUMBER REGISTER)	Use an argument to the command to specify the number value.	
Store 0 into Register <reg></reg>	• C-x r n <reg> • <f11> r n <reg></reg></f11></reg>	(number-to-register NUMBER REGISTER) (pel-number-to-register NUMBER REGISTER)	If no argument specified the number 0 is stored in the register. specify another value enter it as a numeric argument.	
Increment value stored in register <reg>by NUMBER</reg>	• C-x r + <reg> • <f11> r + <reg></reg></f11></reg>	(increment-register PREFIX REGISTER)	If no argument, increment by 1. To increment by a larger amour specify the number via a numeric argument. For example, to increment register a by 35, use "M-3 M-5 <f11> r + a"</f11>	
Copy region rectangle into register <reg></reg>	• C-x r r <reg> • <f11> r r <reg></reg></f11></reg>	(copy-rectangle-to-register REGISTER START END &optional DELETE-FLAG) (pel-copy-rectangle-to-register REGISTER START END &optional DELETE-FLAG)	If a prefix (C-u) argument is used, delete the rectangle from buffer.	
Copy region text in register <reg></reg>	• C-x r s <reg> • <f11> r t <reg></reg></f11></reg>	(copy-to-register REGISTER START END & optional DELETE-FLAG REGION) (pel-copy-to-register REGISTER START END & optional DELETE-FLAG REGION)	If a prefix (C-u) argument is used, delete the text from buffer.	
Prepend region text to text in register <reg></reg>	<f11> r , <reg></reg></f11>	(prepend-to-register REGISTER START END &optional DELETE-FLAG)	F11 Mnemonic: the , key is on the same key as < (which points toward the end of text).	
Append region text to text in register <reg></reg>	<f11> r . <reg></reg></f11>	(append-to-register REGISTER START END &optional DELETE-FLAG)	F11 Mnemonic: the . key is on the same key as > (which points toward the end of text).	
Insert register data at point: - filename - number - rectangle - text	• C-x r i <reg> • <f11> r i <reg></reg></f11></reg>	(insert-register REGISTER &optional ARG)	Normally it leaves point after the inserted text and the mark before. With a numeric argument it puts the point before the text and the mark after.	

Registers - References

Topic & Link	Description		
GNU Emacs - Registers			
Register names	Single characters. Control and escape sequences can be used.		
Stack Overflow - Preserve Window layout	Describes a set of packages that can also be used. Registers seems to be the best way to store named layouts though.
