```
Writing Perl scripts
                               Impose strictures in Perl files to prevent errors by adding one of the following use lines. Also see the strictures package.
                                                               #! /usr/bin/perl -w
                                                                                                             Executable Perl script should have a valid <u>shebang line</u> identifying the <u>appropriate location</u> of the Perl interpreter. <u>It may have to be modified at installation time</u> (<u>OpenGroup/SUS</u>).
                              #!/usr/bin/env perl
Use the following at the
beginning of Perl script
                                                                use v5.12; # loads strict ...
use v5.35; # &loads warnings
                              use strict;
                                                                                                              1 It's best to: use warnings; perl -w generates warning for all Perl code in the program
                              use warnings;
                                                                                                              including modules used by the program. Also use the \underline{-c} option to check syntax.
                                                                use diagnostics produces
                                                                                                              But most Perl code should also activate the strict Perl rules and warnings to detect
                                                                                                              warnings. See: Barewords in Perl
                                                                more info but increases startup time.
                              # for testing only:
                              use diagnostics;
     perldiag @ perldoc
                                                                Alternative: perl -Mdiagnostics. Emacs pel-perl-critic command can report diagnostic.
                                                                This can be used to enable both the strict and warning pramas as well as several named features.
use version/features
                              <u>use</u> v5.36;
                                                                  See the table listing the feature bundles per Perl versions.

Perl 5 Operators
                             Perl operators, listed below with their precedence and associativity.
Perl 5 Operators
                                                                                                                                              C Operators missing from Perl: unary &, unary * and (type)
                   Note:
                             · Quote and Quote-like operators: in Perl quotes are operators and they provide various kind of interpolating and pattern matching capabilities
Associativity: one of:
                             left
                                          terms and list operators (leftward)
                                                                                      ( )
                                                                                                                                         Note: print, sort, reverse, chmod, are list operators
  right
                             left.
                                           Arrow Operator:
                                                                                      _>
  left
                             NA
                                                                                     ++ --
                                          Auto-increment and Auto-decrement:
  NA: not associative:
                                           Exponentiation:
                              right
  cannot use more than one of these operators
                             right
                                           Symbolic Unary Operators:
                                                                                             -. \ and unary + and -
                                                                                                                                         Note: The operator \ <u>creates a reference</u>. See <u>example</u>.
                             left
                                          Binding operators:
   in sequence.
                             1eft
                                          Multiplicative Operators:
                                                                                         /
                                                                                             %

                                                                                                                 $d{99, 'Feb'}
            $Dog'days
                               $Dog::days
                                                     The $days variable inside the Dog package.
                                                                                                                                      Multi-dimensional hash emulation

    Arrays are initialized by literal lists

                                                                                    • You can assign a list of values to a list of variables. Useful to swap: ($val1, $val2) = ($val2, $val1);
list and Array
  0-based indexed (first
                                                                                    • If there are more variables than values: the extra variables are set to <u>undef</u>. Extra values are ignored.
                               · Lists are always flattened in Perl:
  index is 0).
                                 • This means that (1, 2, (10, 20, (100, 200), 30, 40), 4) is exactly the same is (1, 2, 10, 20, 100, 200, 30, 40, 4). Use references to create nested data structures.
  @name is $#name
                                                                                                                • A list is an ordered collection of scalars (of any type).
                                                 Array containing ($days[0], $days[1], ... #days[$#days])
                               @days[3,4,5] Array <u>slices</u> containing ($days[3], $days[4], $days[5])
@days[3..5] Array <u>slices</u> containing ($days[3], $days[4], $days[5])
                                                                                                                • An array is a variable that contains a list
                                                                                                                  Reading beyond the end of array returns undef
                               • Negative indices used in read access from the end: -1 is last item
                                  Use these negative indices to access from the end. Do not compute index with $#name -3, if the list size is 2, this will give invalid results.
                                 Use a slice to select multiple elements from a list, array, or hash.
                                                                                                                 my @extracted = (6, 2, 8, 4);
                                                                                                                                                             my @digits = (0..9);

    array slices LPo

                                 Don't use a slice when you know you need exactly one element. An Ivalue slice imposes list context on the righthand side.
                                                                                                                 my @choices = @digits[@extracted]
my $mod_time = (state $filename)[9];
                                                                                                                                                             my @one2five = @digits[1..5];
my @premiers = @digit[1, 2, 3, 5, 7];
    Simple explanation

    Assign to array slice to update several values. ➡

                                                                                                                 @extracted[1, 3] = (7, 9);
                                 What are the advantages of anonymous array? @ StackOverflow Perlref @ Perldoc, Perl reference tutorial @ Perldoc

    Anonymous array := a type of array reference. Use it to build nested data structures.
    Array reference allows Perl to treat the array as a single item.

    Anonymous arrays

                                                                                                                                                       Initialize a hash slice with array context:
Hash/associative array
                                                                  Associative array (hash): keys-value pairs. Can be initialized as:
                                            %days
Hashes @ Perl Maven
                                                                    my %days = (Jan => 31, Feb => $leap? 29 : 28, ...)
my %days = ("Jan", 31, 'Feb', $leap? 29 : 28, ...
                                                                                                                                                      @char_to_num{'A' .. 'Z'} = 1 .. 26;

I/O
Format
Typeglob
                               A typeglob is a symbol table structure with the slots of that symbol for the scalar, array, hash, code, format and I/O form of the symbol in the namespace.
                                                                See: Object Oriented Perl, section 2.2.4. Typeglobs. Advanced Perl Programming, 1st Edition Section 3.2
                               A reference is a scalar variable whose value is a pointer to another Perl variable. Use it to build more complex data types. Make reference with 1.
References
Perl references intro
                               The ref built-in returns a string describing the referent: ARRAY, HASH, CODE, FORMAT or IO. It will also return the class name of an object.
Perl reference tutorial
                               my @array = qw(a, b, c);
print array[1]. # b
                               my @array
                                                                 my  array_ref = ['a', 'b', "c\n"];
                                                                                                                 my %hash = (a=>1, b=>2, c=>3);
                                                                                                                                                             my $hash ref = {a=>1, b=>2, c=>3};
Reference purpose
                                                                                                                                                             print ${$hash_ref}{c}; #3
print $$hash_ref{c}; #3, simpler
                                                                  print ${$array_ref}[1]; # b
                                                                                                                 print $hash{c}; # 3
<u>IntPo</u>
                               You can create complex data with references: #### b, simpler print $array_ref[1]; # b, simpler print $array_ref->[1]; # b, arrow notation
                                                                                                                                                             print $$hash_ref{c}; # 3, simpler
print $hash_ref->{c}; # 3 with arrow notation

← drop brace around bareword ref.

    brace around refs:

                                                                                                                 ← arrow notation is shorter/cleaner ➡
                               with references: ₩₩₩
circumfix dereferencing:

    simplify with ->

                               my $data = [0, 1, 2, [40, 50, 60, [100, 200], 70], 8];
                                                                                                                   Creale a lexical reference:
                                                                                                                                                                    my $hash_ref = \%hash;
                              Store a ref to an array or hash into an array: push @array \%hash;
• simplify more
                                                                                                                • Pass array or hash to subroutine: fct(\@a, \%h); Return from sub: return (\@a, \%h);

    Arrows between subscript are optional.

postfix dereferencing
                               (Perl >= v5.20.0) Instead of using a sigil prefix, it uses a postfix sigil and star. sref:ref to scalar, aref:ref to array, href:ref to hash, cref:ref to code, gref:ref to glob

                               A closure binds its environment and keeps it to use it when invoked.
                                                                                                                 sub make greeting
Closures
                                In the example at right, a greeter function is built and returned, remembering how to greet. It is used like this:
                                                                                                                      my $greet = shift;
my $greet_fct = sub {
    my $name = shift;
 Perl closure
                                   my $fr = make_greeting("Bonjour");
my $it = make_greeting("Buongiorno");
$fr->('Brigitte'); # prints: "Bonjour, Brigitte!\n"
$it->('Madonna'); # prints: "Buongiorno, Madonna!\n"
  Note how easy it is to
                                                                                                                            print "$greet, $name!\n";
create a closure in Perl: a
simple block that defines
                                                                                                                       return $greet_fct; # return ref to internal function
a lexical variable
referenced by subroutines defined in that block. The variable is not accessible
                               A code block defining lexical variable(s) and subroutines consist of a
                                                                                                                 { my $count;
                                                                                                                                               # lexically scoped variables are only accessible inside the block
                                                                                                                   sub add_1 { count += 1; } # but the subroutine is not lexical it's visible sub get_count { return count; } # in the package (main by default).

# The lifetime of the subroutines is the program, keeping the referred-to variables alive!
                               closure too! With the following example, the add_1() subroutine
outside of the block but
the subroutines are!
                               increments the $count and that's returned by get_count(). The
                                                                                                                   sub get
```

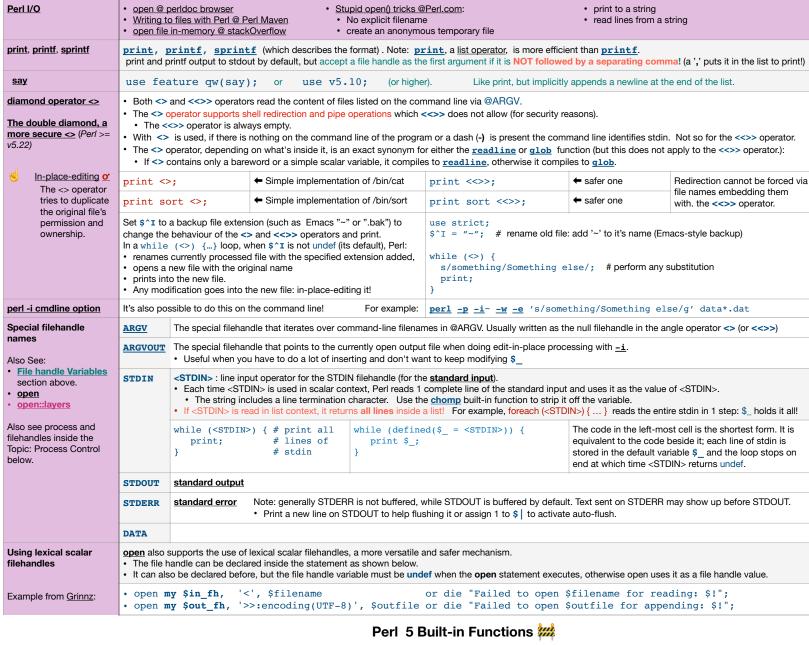

\$count variable cannot be accessed from anywhere else!

Format Variables	The format mechanism is us	e to generate p	rinted layouts. It's an o	ld Perl feature but still useful in	various places.		
Current value of the write() accumulator for format() lines.	• \$ACCUMULATOR • \$^A						
Form feed format. defaults to \f	• IO::Handle->format_form • \$FORMAT_FORMFEED • \$^L			Set of characters after which a string may be broken to fill continuation fields		at_line_break_characters EXPR _BREAK_CHARACTERS	
Number of lines left on the page on currently selected output channel	• HANDLE->format_lines_ • \$FORMAT_LINES_LEF • \$-			Current page length of current output channel	HANDLE->forma\$FORMAT_LINE\$=	t_lines_per_page(EXPR) S_PER_PAGE	
Name of current top-page format of output channel	 HANDLE->format_top_name(EXPR) \$FORMAT_TOP_NAME \$^ 			Report format name of output channel	HANDLE->format_name(EXPR)\$FORMAT_NAME\$~		
Error Variables	The variables \$0, \$1, \$^E, and \$? contain information about different types of error conditions that may appear during execution of a Perl program. They correspond to errors detected by the Perl interpreter, C library, operating system, or an external program, respectively.						
Perl error from the last eval operator	• \$EVAL_ERROR • \$@			Current state of interpreter	• \$EXCEPTIONS_F • \$^S	BEING_CAUGHT	
Current value of C errno integer variable	• \$OS_ERROR • \$ERRNO • \$ERRNO • \$! when used in a numeric context, but returns the string from perror() when used in string context.			Hash of error names to 0 or 1, set to 1 if current error is this error.	• %OS_ERROR • %ERRNO • %!		
OS detected error	\$EXTENDED_OS_ERRO	OR	• \$^E				
Status returned by last pipe close, backtick command, wait, waited, or system() call.	• \$CHILD_ERROR • \$?			native status returned by last pipe close , backtick command, wait() or waitpid() or system() call	\${^CHILD_ERROR	_NATIVE}	
Current value of warning switch	• \$WARNING • \$^W			Current set of warning checks enabled by the use warnings pragma	\${^WARNING_BITS	S}	
Variables related to the interpreter state	These variables provide informations	ation about the c	urrent interpreter state.				
Flag associated with the -c switch	• \$COMPILING • \$^C			The current value of the debugging flags	• \$DEBUGGING • \$^D		
Current phase of the perl interpreter	\${^GLOBAL_PHASE}			Debugging support. Internal variable.	• \$PERLDB • \$^P		
Compile-time hints for the perl interpreter. Internal use only	\$^H			Values of compiled statements	%^H		
Taint mode	\${^TAINT}			Safe locale operations availability	\${^SAFE_LOCALE	S}	
Input/Output Layers. Internal use by PerlIO only.	\${^OPEN}			Unicode Settings of Perl	\${^UNICODE}		
Internal UTF-8 offset caching code state	\${^UTF8CACHE}			State of UTF-8 locale detected by perl at startup.	\${^UTF8LOCALE}		
File handle Variables	See also: Perl File Handles			are used in the Input/Output handlin		guments.	
Name of current file read from <>	\$ARGV	← See <u>diamo</u>	rguments of the script nd operator <>. ➡	@ARGV	Number of arguments minus one	\$#ARGV	
Special file handle that iterates over command-line filenames in @ARGV	ARGV	Special file hand currently open o edit-in-place pro	utput file when doing	ARGVOUT			
Output field separator for the print operator	• IO::Handle->output_field_separator(EXPR) • \$OUTPUT_FIELD_SEPARATOR • \$OFS • \$,			Current line number for the last file handled accessed	• HANDLE->input_ • \$INPUT_LINE_N • \$NR • \$.	line_number(EXPR) UMBER	
Input record separator (newline by default)	• IO::Handle->input_record • \$INPUT_RECORD_SEP/ • \$RS • \$/		PR)	Output record separator	• IO::Handle->outpu • \$OUTPUT_RECC • \$ORS • \$\	ut_record_separator(EXPR) ORD_SEPARATOR	
Auto-flush control order of output @ Perl Maven Suffering from Buffering?	HANDLE->autoflush(EX SOUTPUT_AUTOFLUSH \$I		Perl activates file buffering by default. Assign 1 to \$ to activate auto-flush.	Last read file handle	\${^LAST_FH}		

Perl 5 Input/Output

Example from Grinnz:	• open my \$in_fh, '<', \$filename or die "Failed to open \$filename for reading: \$!"; • open my \$out_fh, '>>:encoding(UTF-8)', \$outfile or die "Failed to open \$outfile for appending: \$!";						
Perl 5 Built-in Functions							
Perl Functions Perl syntax	To get information about a Perl function from the command line use the perldoc -f command. • To get information about print use: perldoc -f print						
Cautionary notes	Some of the Perl functions exhibit various limitations and the vary over Perl versions. This section describes the ones I am aware and the proposed alternatives.						
each keyword is broken Use Var::Pairs instead.	Do NOT use the built-in each. It is broken, as described by <u>Damian Conway</u> in his <u>Modern Perl Best Practice O'Reilly course</u> , section control structure. • each is not re-entrant: • nested loops of each over the same hash does not work as expected and will create infinite loop since the nested loop each juts iterates from where the first loop each left it. • Exiting the loop leaves the state of the each internal pointer at the current location. • If you use each on the same hash later it will resume from where it left, it will not start form the beginning.						

Perl 5 Statements

			1 011 0 0	ratements m.	
Loop control	See perlsyn for more informati	ion on Perl syntax	which includes declaration	ons, blocks, loops, labels, subrouting	nes, etc
Use the <u>last</u> and <u>redo</u> inside a naked block of code to control looping.	loop control keywords: 1ast g: exits the loop. next g: starts the next itera redo g: restarts the loop ble evaluating the condition again	ock without	The last, next, and g work in the following co while (condition of the for (init; condition of the for (and the for condition of the foreach array { on the following the following the foreach array { on the following t	ion) { } ion) { } on; continue) { } }	Notes: • The while and foreach loops may have a continue block: executed before evaluating condition again, which corresponds to the 3rd part of a for loop statement. See this @ stackOverflow. • Blocks can be labelled of as targets to last, next, and redo
Statement modifiers	if EXPR unless EXPR while EXPR until EXPR for LIST foreach LIST when EXPR	processed. The has "END" of foreattents	•	a list context; the complete list is wing trying to stop on a line that reads all of STDIN:	The while statement imposes a scalar context; it takes one line at a time from <stdin> and the following code works properly: while (<stdin>) { last if /_END/; ; }</stdin></stdin>
do block	 The do block is *very useful* to set a value based on several conditions, just as the ?: conditional operator but with an explicit block that may use scoped variables. Takes advantage of a block value is the value of the last expression executed inside the block. Do *not* return from the block. The last, next and redo cannot be used inside do blocks. 			<pre>if (\$perl_nirvana < 5 & elsif (some_other_cond elsif (\$emacs_nirvana</pre>	<pre>ccs_nirvana) = check-nirvana-levels(); & \$emacs_nirvana < 8) { 'study-Perl' } d()) { 'time-to-cook' } < 7) { 'look-into-eieio' } go-skiing' : 'go-canoeing' }</pre>
Compound statements					
if, elsif, else					
unless					
?: conditional operator					

Perl subroutines	See Object Oriented Perl, section 2.1.4 : Subrou	utines				
Defining subroutine	Defined with the <u>sub</u> keyword followed by a beginning.	olock.	sub greet { print "hello!\n"; }			
Calling subroutine	If the subroutine definition follows its invocati subroutine name are required, as in: greet();	on, parentheses after the	But if the definition was above the call, the parentheses Subroutine sigil is &. It can optionally be used in a call;			
calling method	Parentheses are required if arguments are particular optional if there is no arguments.	ssed to method, but	<pre>\$obj->method_with_args(\$val1, \$valb); \$obj->method_without_arg; \$obj-</pre>	>method_without_args();		
subroutine &	Why we teach the subroutine ampersand Why should I use the & to call a Perl subrouting.	ne? @ StackOverflow	Another point of view: <u>Subroutines and Ampersands</u> Note it must be used to <u>make a reference</u> to a subroutine	ne: \$greeter = \& greet;		
subroutine arguments passed by list always variable by nature	The arguments passed to a subroutine are av special array. The caller code supplies a list of values. Rem nested lists lists are flattened in Perl.		@sorted = alpha_order('Nice', 'Québec', 'Montréal'); @sorted = number_order @unsorted_numbers; @sorted = alpha_order('Trois-Rivières', @sorted, 'Gaspé', 'Rimouski');			
• named arguments Note: The @_ is an alias to the passed values; changing them inside the subroutine affects the caller's values.	Since hash declaration take a list of key/value implement a passing named arguments! It's also possible for the subroutine to set def expected arguments by taking advantage of lists, list are flattened and hash can be assign values are used.	aults for some of the the fact that hash are	<pre>Implementation: sub move { my (%directions) = @_; } Caller:</pre>			
Subroutine Prototypes	An older Perl feature. Clashes with subroutine s	ignatures as of Perl v5.20.	In Perl >= v5.20 put the :prototype attribute before sub	proutine prototype parenthesis.		
Subroutine signatures	Exactly zero arguments	()	Zero or 1 argument, no default, unnamed:	(\$=)		
Perl >=5.36: StablePerl >= 5.20:	Zero or 1 argument, no default, named	(\$val=)	Zero or 1 argument, named, with default	(\$val=1)		
Experimental See: Use v5.20	exactly 1 named argument:	(\$val)	Exactly 2 arguments	(\$v1, \$v2)		
subroutine signatures	2, 3 or 4 arguments no defaults: (\$v1,	\$v2, \$=, \$=)	2,3 or 4 arguments, 1 default:	(\$v1, \$v2, \$v3='a', \$=)		
	Two or more, any number of arguments.	(\$v1, \$v2, @)	Two or more arguments, remainders into a named array:	(\$v1, \$v2, @rest)		
	Two or more arguments: an even number	(\$v1, \$v2, %)	Two or more arguments, remainders into a named hash:	(\$v1, \$v2, %rest)		
	Class method	(\$class,)	Object method	(\$self,)		
Returned value. Detecting calling context with wantarray	 The result of the last evaluated expression is implicitly returned. The <u>return</u> operator can be used but it's not required unless used to change execution flow (return immediately from the subroutine). The subroutine can return a scalar in scalar context or a list if called in list context. Inside the subroutine, use the <u>wantarray</u> function to determine the calling context of the subroutine call and why it should return: 					
Identify caller	The caller built-in returns information about the	subroutine caller inside a	n array: (package, file_name, file_line). In scalar context it re	eturns the package only.		
Continuation with goto	The goto built-in can be used by a subroutine to	continue its execution in	to another subroutine. Not for all but useful in some specifi	c cases such as autoloading.		
	•					

Perl 5 Modules

Perl Modules								
Perl core modules		check if a module is installed : perldoc -1 Module check if a module is part of Perl core : corelist Module (Perl >= v5.9.2)						
Access to Modules	Provide ac	cess to modules in your code with one of the following: do , require or use						
Modules @perltutorial Modules Using simple modules or	<u>do</u>	Looks for the module file by searching the Looks for the module file by searching the Looks for the module file by searching the Looks for the module file by searching the Looks for the module file by searching the Looks for the module file by searching the Looks for the module file by searching the Looks for the module file by searching the Looks for the module file by searching the Looks for the module file by searching the Looks for the module file by searching the Looks for the module file by searching the Looks for the module file by searching the Looks for the module file by searching the Looks for the module file by searching the Looks for the module file by searching the Looks for the module file by searching the calling program and executes it. Otherwise, Perl will skip the do statement silently. The "included" code does not have access to the lexical variables from the main program. Skip the Looks for the lexical variables from the main program. Skip the Looks for the lexical variables from the main program. Skip the Looks for the lexical variables from the main program.						
	require	Loads the module file once, also searching the @INC path. Performed at run time (a fit the require for the same file appears twice, Perl ignores it. Perl will issue an eresult of Skip the @INC path lookup if given a file path starting with ./,/, or /						
The <i>normal</i> way to access Perl modules →	use	Similar to require except that Perl applies it before the program starts: it's done at compile time . Modify it dynamically in a BEGIN block. See IntPo . • Therefore the <u>use</u> statement cannot be invoked inside conditional statements such as if-else. Used often to include a module in a program. That imports the defaults as defined by the module's code. Select what to import with one of the two equivalent forms: (See IntPo): • <u>use</u> Module::Name ('function_a', 'function_b'); • <u>use</u> Module::Name <u>gw</u> (function_a function_b); • <u>use</u> Module::Name (); # import nothing. All accesses to the module must be done with Module::Name::something						
Error handling for: Can't locate in @INC How to fix that See Also: IntPor See: show-perl-inc	 Perl look if you have If Perl does Add the Add a us Run Perl 	For the above statements to work Perl must be able to identify the location of the requested module(s). • Perl looks for a module code inside the directories identified by the energy-left-nc- if you have. use The::Module; inside your code, Perl looks for a sub-directory named 'The' containing a file named 'Module.pm' inside each energy-left-nc- It perl does not find it, there are multiple ways to solve the problem : • Add the required directory to the list of directories identified in the ':' separated list in the PERL5LIB environment variable. (use ';' as separators in Windows). • Add a energy-left-nc- is a separators in Windows). • Add a energy-left-nc- is a separators in Windows). • Run Perl with the elft-nc- is a separators in Windows). • Run Perl with the elft-nc- is a separators in Windows).						
@ USRHOME	• perl	<pre>directories used by Perl from one of the following equivalent command lines: -e 'print join("\n", @INC), "\n";' -le 'print for INC';'</pre>	You can also get more information with perl -V					
Specially Named Blocks		named blocks are run at the beginning or end of a running program: BEGIN , UNITCHE N block - running code during compilation. Note the security risk warnings. The BEGIN						
Declare packages	In Perl a package can span several files and one file may contain the code of several packages. The package starts with the package literal contains the name of the current package.							

Topic: Data Introspection

Data Introspection						
Using Perl Debugger	Debug a pr	ogram:	perl -d program	_name	program_args	
Debugger Tutorial	Debug inte	ractive session:	perl -d -e 0			
Debugger commands	q	Quit debugger		s	single step	
	h	help. List all availa	ble commands.	x	evaluate expression	
Modules for Data introspection	Data::Dumper (Perl >= 5.005) It provides the Dumper function that prints strings that can be used by eval to rebuild the data.			• Pa	s similar to the x command of the debugger. ss reference to the variables , otherwise it extends ther and show each entry as its own variable.	<pre>• print Dumper(\@array); • print Dumper \%hash;</pre>
	<u>Data::Dump</u> (Requires Perl >= v5.6.0)			comp	des a dump function that has nicer output, but is not entible. mp() prints on the stdout. No need to use print.	<pre>use Data::Dump qw(dump); dump(\@array); dump(\%hash);</pre>
	Data::Printer			to	provides the p subroutine that does not require a refere the variable as it inspects it first. prints on the stdout. No need to use print.	use Data::Printer; p(@array); p(%hash);
Data Marshalling		everal modules, eit		re or o	utside, that provides mechanism to marshall/serialize a	and unmarshall/de-serialize data.

Topic: Directory Operations

Directory Operations	In Books: LPo			
Opening Files	All file open operations are relative to the <u>current workling</u> relative file names)	ng directory (for	open my \$filehandle, '<:utf8', 'a_relative/path.txt'	
Creating temporary files	File::Temp (Perl >= v5.6.1). <u>Using File::Temp</u> • Also see <u>IO::File</u>			
Built-in Functions	Related Functions/Packages / Descriptions		Note	es
Getting file names by: Globbing: with glob	File::Glob (Perl >= v5.6.0) - provides more control.	Example:	<pre>my @all_files = glob '*'; my @perl_files = glob '*.p</pre>	om *.pl'; # 2 globs, space-separated
with the glob operator <>	The <> operator is identifying: • a filehandle, when: the item inside <> is a Perl identifier or an indirect file handle read scalar, • a glob expression otherwise.	Glob examples:		glob: no space, no need for string pl'>; # 2 globs, space-separated
			<pre>my \$etc_dir = '/etc'; my @etc_dir_files = <\$etc_</pre>	_dir/* \$etc_dir/.*>;
			my @files = <larry *="">; #</larry>	# a glob
	See: readline	Filehandle	<pre>my @his_lines = <larry>;</larry></pre>	# a filehandle read
		examples:		indirect filehandle read of LARRY handle LARRY; # another way to write above \$name;
with a directory handle LP	opendir: open a directory: get a directory handle readdir: read the directory handle. But see this. closedir: close the directory handle. DirHandle (Perl <= 5.5) File::Spec::Functions (Perl >= v5.5.4) Path::Class	Example: iterate explicitly over a list of file names extracted from the directory using these 3 functions.	<pre>opendir my \$dh, \$dir or di foreach \$file (readdir \$dh</pre>	Le "Failed opening \$dir: \$!"; h) { side \$dir\n"; # 1 no path in name!
Creating directory	• mkdir	Example:		nissions); # octal for permissions do not use "0700", it's 700 decimal!
Removing directory	rmdir Removes an empty directory. File::Path remove tree , rmtree remove dir & files (in the control of the control o	Perl >= v5.0.1)		
Removing files	• unlink a list or \$_		<pre>unlink 'file1.txt', 'file2 unlink qw(file1.txt file2 unlink glob 'file?.txt'</pre>	•
Renaming files	rename an old file name to a new one. The fat comma operator is sometimes used to highlight what is the old and the new name.	As in here:	rename 'old_name' , 'new_n rename old_name => 'new_n	name'; name'; # use fat comma to quote word left of it.
Changing permissions	<u>chmod</u> changes file permissions			
Changing ownership	chown changes file ownership			
Creating Hard link	link to create a hard link			
Creating symbolic link	symlink to create a symbolic link			
chdir Change current working directory	 File::chdir File::HomeDir Change the current working directory. chdir without argument attempt to change to user home directory using the \$ENV{HOME} and \$ENV{LOGDIR} environment values if ▲ they are set. The File::HomeDir module helps in setting the built-in chdir is global ▲ for the entire program. Use File::chdir facilities for localized operations. 			. The File::HomeDir module helps in setting them.
Modules	Functions Legend: Exported by default, exported on request, W	/in32 specific	E	Extra Information
Cwd	getcwd, cwd, fastcwd, fastgetcwd, getdcwd abs path, realpath, fast abs path		my	e Cwd; \$curdir = getcwd; int "cwd is \$curdir\n";
File::Basename	fileparse, basename, dirname,			
File::Spec File::Spec::Functions	functional interface to methods: <u>canonpath</u> , <u>catdir</u> , <u>splitpath</u> , <u>splitdir</u> , <u>catpath</u> , <u>abs2rel</u> , <u>rel2abs</u> . All can terminate of the split of the spli			absolute, path. devnul, tmpdir, case tolerant,
File::Find : Traverse a directory tree. See: File::Find::Closures	find, finddepth, %options. In wanted: File::Find::dir. Note that \$_gets the base name of the file (no path). It perform filetest operations in the example here (as exp-s, and implicit argument to -d and -f). This traverses the find of the file of	is used to licit argument to	if (-d or -f)	%4d, %s\n", \$_, -s \$_, File::Find::name) and (\$_ ne "."); }, '.'); s inside all directories not showing the directory name

Topic: List Operations

			Topic. List Operations				
List Operators							
Sorting lists	sort	Sort a list	<pre>my @sorted = sort @unsorted_list;</pre>	in place: my @data = sort @data;			
	reverse	Sort a list in reverse order	<pre>my @rsorted = reverse @unsorted_list;</pre>	in place: my @data = reverse @data;			
Filtering list with grep	my @adult_	_ages = <u>grep</u> \$_ > 18, @ages;	my @lucky_ages = grep /7\$/, @ages; # all that end with 7	my @read_ages = grep { \$_ >= 7 && \$_ <= 77 } @ages;			
Counting matches	my \$count	my \$count = grep \$_ > 18, @ages;					
	An express	ion, subroutine or block with trailing b	poolean can be used as the grep criteria. Each item in the lis	t is identified inside grep by \$_			
	The block	• The block is an anonymous subroutine. 🤞 Return a boolean from the subroutine, but fall-off, do not return, from a block!					
Transform a list with map							

Topic: Process control

			Topic: Process control			
Process Control	In Books: <u>LPo</u>	Important se	curity information: perldoc perlsec			
Environment Variables	Inside the %ENV hash.	Perl %Config ha • To use it: us	ash: Perl configuration information. For example, whether it se Config;	support threads, what are path separators, etc		
Built-in Functions	Example		Description/ Note	es		
system (2 functions)	system 'ls -1 \$HOME'	;	Run child process asynchronously using parent's stdin, std	out and stderr, using the OS native command shell.		
using the shellsecurity risk?	<pre>system "cd \$project;</pre>	make &";	Use the Unix shell to execute a long running build asynchro Using the shell to build commands from unvalidated use	•		
avoiding the shell	system 'tar', 'cvf', \$tarfile, @	@directories;	No shell invoked when more than 1 argument is passed to	system. No shell interpretation, piping, re-direction done.		
other syntax	system('tar', @arguments);		0 means success: unless (system 'tar', argumen	ts) { print "tar command success\n"; }		
	<u>system(</u> { \$prog }, \$arg0, @					
	Note that if the string conta	in no shell metac	haracters it is executed directly (not through a shell).			
system return value:	2 bytes: MSByte: child pro	gram exit code.	<pre>my \$retval = system();</pre>			
A value of 0 usually means all was OK.	LSByte: system-s information bits: • 0x80 : set on co • 0x7f : signal no	ore dump.	my \$childp_exitcode = \$retval >> 8; my \$had_core_dump = (\$retval & 0x80) == 0x80? 1 : 0; my \$had_number = \$retval & 0x7f; shift most significant byte			
exec	Unlike system, exec does not	return to the pare	nt Perl process. Use: <u>exec</u> 'the_program' or <u>die</u>	"Could not run: \$!"; #or warn or exit		
backquotes``	Use backquotes to capture the The trailing newline is not file		gram. That's the main point of using it. e filter by chomp.	<pre>chomp(my \$current_date = `date`);</pre>		
	invoke the shell if there are a • The following example bu • Note that `` is also written	any shell meta-cha uilds a dictionary (l n as qx/ /	e the single double quote string argument of system: it will aracters and supports interpolation. hash) of topics with the text extracted from peridoc. 1 string. In list context it returns a list of strings (1 per line).	<pre>my @topics = qw(die warn exit); my %info; foreach (@topics) { \$info{\$_}} = `perldoc -t -f \$_`; }</pre>		
Modules						
Capture streams	<u>Capture::Tiny</u>	Can be used to	capture the stdout and stderr streams for various ways if exe	ecuting other programs		
Inter-process support	IPC::System::Simple		d to capture streams and provide more inter-process supported to capture streams and provide more inter-process supported to to capture uses the shell, along with other useful full full to capture to the capture of t			
Processes as filehandles	In Books: <u>LPo</u>					
Perl - program	Launching a process that pipes into the Perl process		e or die "Cannot pipe from date: \$!";	Use a bare word to define the DATE file handle.		
	pipes into the refripecess		fh, '- ', 'date' or die "Cannot pipe from date: \$!";	This one and the others define a local file handle variable. The file handle variable can later be used to read, as the		
		open my \$ps_fh	fh, '- ', 'ps', 'aux' or die "Cannot pipe from ps: \$!"; above one, but is not global.			
		open my \$find_f	fh, '- ', 'find', qw(name '*.p[lm]' -print) or die "Cannot pipe from find: \$!";			
Perl ➡ program	Launching a process that the Perl process pipes into.	open my \$dispa	ther_fh, ' -', 'dispatcher', qw ('-to-perl-groups' 'Help!') or o	die "Cannot pipe to the dispatcher: \$!";		
Forking	In Books: LPo . See also: Line	ux fork(2) system	call, QA: Why do we need fort to create new processes? M	/hy fork woks the way it does?		
fork with exec and waitpid See also: Other IPC functions Perl IPC	 fork the process into parent and child. in the child process start the program with exec In the parent process wait for the program termination with waitpid defined(my \$process_id = fork) or die "Fork failed: \$!"; unless (\$process_id) { # Inside the child process (created by fork) exec 'long_running_process' or die "Failed starting long_running_process: \$!"; # Inside the parent process, wait for completion of long_running_process. 					
Signals	In Books: <u>LPo</u>					
kill	Sends a signal to a list of processes. • The signal may be identified by number or name (string), which is more portable. • The <pre>§Config{sign_name}</pre> provides the supported signal names.					
	Note that the fat comma operations	erator (=>) can be	used to automatically quote signal name:	kill INT => \$pid or die "Can't signal \$pid with SIGINT: \$!";		
	If the signal is 0 or "ZERO" is signal to the process: ie: if the signal to the process: ie: if the signal to the process.		the process; instead Perl checks if it's possible to send a	unless (kill 0, \$process_id) { warn "Process \$process_id is no longer running!"; }		
	If the signal is a negative nu identified by the process screen.		nat starts with '-' the signal is sent to the process group	• <u>kill</u> '-KILL', \$process_group • <u>kill</u> -9, \$process_group		
Signal handlers	Set the signal handler by se 'SIG' prefix) to a string holdi			<pre>\$<u>SIG</u>('INT') = 'dispatcher_int_handler';</pre>		

PerlTidy formatting control *******

• $\underline{\text{Log::log4perl}}$ is an implementation of the popular Apache $\underline{\text{Log4j}}$ for Perl.

	. oay ioau	
perItidy option	Option	Impact
indentation style	bl,opening-brace-on-new-line	 Without this option (the default) the code indentation style selected is <u>K&R style</u>. With this option, the indentation style is <u>Allman/BSD style</u>.

Perl supports the warn buil-in to generate warnings on stderr.
The <u>Carp::carp</u> from the <u>Carp</u> package, provides more information.

Error Logging and Reporting
