## **PEL PDF Documents Legend**

Symbol/ colour	<u>Purpose</u>	Description and Examples
Table Title		alent PDF file titles showing in browser tabs) use a prefix symbol to identify the overall purpose of the table. Most table titles use a single oles related to Emacs Lisp, use more than one.
>	Document related	This table contains information related to the overall document only, such as this legend.
<b>\( \)</b>	Generic Emacs • global bindings • mode specific bindings	The ∑ symbol is used in the table titles of tables that describe general Emacs feature set such as abbreviation, bookmarks, buffers, navigation, etc In opposition to features specific to a specific major or minor mode.  • In those tables, most keys are global bindings and the key description cells for global bindings have a white background.  • The keys that are specific to a major mode are highlighted with a light green or light blue background. The keys with yellow background are also available in other modes but behave differently. See description of the background colours for key bindings below.
X.	Emacs Lisp • mode specific bindings	This table contains information related to Emacs Lisp Development.
<b>P</b> I	Programming language - Major Mode • mode specific bindings	The two stylized PL letters are used in the table titles of tables that describe a specific set of Emacs major modes specifically designed to support the editing of files written in a specific programming language.
M	Markup language - Major Mode • mode specific bindings	The stylized M letter is used in the table titles that describe a specific set of Emacs major modes specifically designed to support the editing a markup languages like reStructuredText, markdown, XML, HTML, etc
(m)	Minor Mode • mode specific bindings	Information about a specific minor mode
Т	Templates	The table describes a text template system used to insert templated text quickly.
8	Availability tables	The page contains tables that describe availability of features.
	Keys/Keyboard	The table describes use of keys such as function keys, numeric keypad, modifier keys.
<b>É</b>	macOS specific	The table describes macOS topics only.
*	Reference	The table contains references to web pages for documentation, examples, tutorial, etc
	Uncompleted	This tab is not completed yet and needs further work.
ani.	Todo	Page in very early stage. Much more work left to do.
Colour Codes	The following colour code	s describe the context, availability, of the key bindings described in the tables.
Black	Standard <b>global</b> key binding	Bindings that are mostly always available in standard Emacs: global key bindings.
Underlined	Key chord keys	<ul> <li>With PEL user option pel-use-key-chord set to t, PEL activates the key-chord external package along with global and mode-specific key chord bindings identified in the pel-key-chords user option.</li> <li>A key chord is a group of 2 normal, non-modifier keys that must be typed simultaneously to activate the action identified in the key chord definition.</li> <li>This is not something like C-s, where the Control key and the s key are type together to do a CONTROL-S or where M-b represents using the Meta key and the b key together.</li> <li>PEL default for pel-key-chords are identified in the tables of this document with the characters underlined.</li> <li>In some cases the key-chord is a simple binding to execute a command. In that case the 2 key-chord keys are shown in the keystroke column alone, simply underlined.</li> <li>In other cases, the key-chord inserts characters and execute commands. In such as case, the 2 key-chord keys are also shown in the keystroke column alone, but instead of describing the function in the function column, the cell shows the key-chord string which represent both the character inserted and the key code for the command.</li> <li>For example, the key-chord that consist of typing the &lt; key and the &gt; key together is represented as the &lt;&gt; key-chord and the expansion is show as "&lt;&gt; \C-b". The effect is to insert both angle brackets and put point in between, since C-b is bound to to command backward-char.</li> <li>The color of the key-chord corresponds to the availability of the commands used, if any. A key-chord that depends only on Emacs standard commands or simple characters is therefore shown in black.</li> <li>The use of key-chords can be toggled by executing M-x key-chord-mode, which PEL binds to <f11> M-k when pel-use-key-chord is set to t.</f11></li> <li>For more information on PEL key-chords see the ∑ Key-Chord table.</li> </ul>
Violet	Standard global key binding for Emacs execution	Same as above except that the keys are available to provide access to the various Emacs Lisp functions by name or execution of Emacs Lisp forms from the minibuffer.
Light Green	PEL global key bindings	<ul> <li>When used to highlight key sequence: denotes a key sequence available in the PEL package.</li> <li>When used to highlight an Emacs Lisp command, indicates that the code is implemented by the PEL package.</li> </ul>
Dark Green	PEL mode-specific bindings	Used to highlight key sequences available in the PEL package that are selected by the mode of the current buffer. These are special local mode bindings, but specific to the PEL system and which may be active while other modes are active. Most PEL specific bindings use function keys prefix to avoid clashes with currently popular bindings.
Light Teal	PEL prefix to external package key map	Several packages come with pre-defined key maps and prefix key suggestions. If the prefix key is different than the prefix suggested by the package but the remaining keys remain the same in the key map, this colour is used for the keys.
Teal	Hydra key	With PEL user option <b>pel-use-hydra</b> set to <b>t</b> , PEL activates the <b>hydra external package</b> and also creates several Hydra key sets. The keys that activate the hydra are identified using the teal color.  Example: The <f7> <f9> keys activate the pel-∑buffer and then a command can be executed by typing the <f9> key. It can then be repeated by typing the <f9> key again, and again, as long as the pel-∑buffer Hydra is active. The key binding cells show the key sequence like this, with the image used for a bullet:  ★ <f7> <f9> <f9> <f9> <f9> <f9> <f9> <f9> <f9< td=""></f9<></f9></f9></f9></f9></f9></f9></f9></f7></f9></f9></f9></f7>
Pink	Customizable prefix key	Identifies the prefix keys that can be easily modified via Emacs customization. The default value of the prefix key is shown in pink, followed by the other keys using the color describing their origin. Example of such customizable prefix keys is the prefix key used by <a href="Isp-mode">Isp-mode</a> . PEL does not impose any value for these prefix keys. The PDF table describing the binding describe how to customize these prefix keys and may suggest good alternative prefix keys.
	Remapped Key	Identifies a key sequence normally bound by Emacs that PEL remaps for other purpose.
Red		
Orange	Key sequence not available in terminal mode	Key sequences highlighted in orange are not available in terminal (termcap) mode, inside a OS shell.  They are only available when emacs in running in graphics mode.

Symbol/ colour	<u>Purpose</u>	Description and Examples	
Blue	Command using external package	Key sequence set-up by the PEL package that uses a command from an external package that must be installed and loaded.  The blue color is used if the key binding is defined by the external package itself.  If PEL defines it's own binding for the key then the key colouring is one of PEL's keybinding color (either light or dark green).  In all cases the description of the key includes a "requires external package" note using the symbol.	
Dark Blue	Command using external package	Reserved. Consolidation of the colouring is underway in this document.	
Coral	Command available only in special mode	Some commands, like debugger commands, are available through simple keys in the buffer where the mode is active, but are also available in other buffers, where the mode is not active. The commands that are available in the buffer where the mode is active are coloured in coral color. These constitute "local" bindings (for the specific mode) and may therefore conflict with the global binding other local binding of the same key chord.	
Grey	<ul> <li>Translated key</li> <li>Using M-x</li> <li>Using M-:</li> </ul>	<ul> <li>Emacs translates some key combinations to other keys. For example Shift-F5, <s-f5>, is translated to <f5> so any binding to <f5> is also accessible if the shift key is pressed while the F5 key is pressed. The original keys do not have a specific key binding. They could have one. Of course in some case you may want to keep it unchanged (for example because the Shift key may indicate something like starting or extending the mark in transient mark mode). In any case, when such a key is described in the various tables, the colour of that key is grey.</f5></f5></s-f5></li> <li>All Emacs commands (functions that are marked interactive) can be executed via the M-x command. Some of the commands have no other key bindings. If there is no other pertinent information to show for the command (such as marking the command orange because it is not available in Terminal/TTY mode), then the M-x binding is shown it is displayed in grey as a reminder that it's not a specific binding, just a use of the (execute-extended-command) command, which is bound to M-x.</li> <li>Emacs also allow execution of any Emacs Lisp expression using the (eval-expression) command bound to the M-: key. Those are also coloured grey.</li> </ul>	
Light Grey	Unused key binding	A key binding that is not necessary and could be re-used for some other functionality.	
Header Cell Colours	The list and meanings of the	ferent background colour to help highlight the purpose of the group of commands and make it easier to quickly find a topic.	
	Navigation commands.  Navigation, cross-reference	o commands	
	Search commands.		
	Completion commands,		
	Replace commands		
	Copy commands		
		e), code/layout re-reorganization commands.	
	Paste, yank commands		
	Insertion commands : inse	ert text, insert templates, skeletons, etc	
	Compilation, evaluation		
	Highlighting and hiding/showing commands.		
	Syntax checking commands (flymake, flycheck,) - deprecated will be replaced by the next color below		
	Syntax checking commands (flymake, flycheck,)		
	Delete, kill, cut commands	5.	
Key Cell Colours	The background colour of	the key cells describes the scope of the key binding. The following rows provide more information.	
	White background. Global key binding available everywhere.	A key binding that exists globally and is available in all normal file buffers and their major modes.	
	Light green. Local buffer key binding set by PEL overriding Emacs global binding to same key	In some specialized modes, like the CC modes, PEL binds a specialized command to a key that Emacs normally binds globally. In most cases, when PEL binds a key like that the command chosen is similar to the original Emacs command but has some more behaviour required for the mode where it is used. Also in most case PEL binds the original Emacs command to a <f12> key prefix with the same key, so the user can still access the original behaviour with the original key prefixed with <f12>.</f12></f12>	
	Light blue. Key binding active only in specific major modes	Used to colour cells of tables describing generic concepts. In those tables where most keys have global bindings,  • the keys with global bindings have a white background.  • the keys with a light blue background describe key bindings specific to a some major mode, described in the key description.  In tables describing the bindings of the specific major modes, this background colour for the same command key binding is not used.	
	Light yellow. Key binding where function adjust behaviour between major modes	A global key binding to a command that adapt its behaviour to the current major mode.	
	Light red. Key binding active only when a specific minor mode is active.	Used to colour cells of tables describing generic concepts. In those tables where most keys have global bindings,  • the keys with global bindings have a white background.  • the keys with a light red background describe key bindings specific to a some minor mode, described in the key description.  In tables describing the bindings of the specific major modes, this background colour for the same command key binding is not used.	
	Darker red. Key bindings active only for when minor mode is active and over <b>buttons</b>	Some minor modes activate key bindings that are only active over text that is transformed into clickable buttons. For example: <b>goto-address-mode</b> The keys activated over these buttons for these modes are showing in a cell with this colour.	
	Lilac. Key bindings active only for input completion during a prompt.	Emacs support prompts with input completion. Various special keys involved in the completion are available in various modes. This color is used in the key sequence cells for completion keys.	
	Darker Lilac. Key bindings active in the completion window	During input completion, if a command is issued to mode point into the completion window where all possible completions are listed, these keys have special meaning.	
Notes	are completion willdow		
**	Powerful command	Used in the <b>Keystroke</b> column to highlight commands that are specially powerful in the sense that they integrate a relatively large and useful set of features. The description of these commands should be read carefully and fully understood.	
•	Requires External Package	This symbol identify features that depend on external packages.  Some of PEL's features require the use of external packages, packages that are not part of the standard Emacs installation and which must be installed separately. Most are Emacs Lisp packages, but some also require external applications.  PEL customization capabilities allow you to identify whether or not you want to use the features that depend on such external packages.  PEL also attempt to use or implement code that can help you install the required package(s).

It was also to be the player installation of the player installati	60	Customizable	Sall user options variables can be set in Emacs customization (see commands in the row above) and stored in file that is loaded when Emacs starts. You can also set these variables in directory local files and also inside files (via the file local settings). So you can have a general setting for a variable, specialize it for a directory tree and specialize it further for a given file. Emacs allows you to fine tune these user options at the level you want. This is very powerful and flexible. See:  Emacs Customize  Per directory local variables

Table Title  Helvetica Neue - Bold- 20 pt.  Section level 1  Helvetica Neue - Bold- 15 pt.  Section level 2  Helvetica Neue - Bold- 13 pt.  Lowest grouping of lines.  Used at the top of every table.  Used at the top of every table.  Used at the top of every table.  Sometimes the first level is skipped and the second level is used first if the title contains too many letters and we want to reduce the vertical size of the row.  Section Helvetica Neue - Bold- 13 pt.  Lowest grouping of lines.	⋘	Detete backward	
Neue - Bold- 20 pt.  Section level 1	Fonts	Most of the text in the vari	ous tables follows a convention in the use of fonts. These conventions are listed here.
February	Table Title	Neue -	Used at the top of every table.
Section level 2 Helvetica Neue - Bold- 13 pt. Identifies a secondary (sometimes a primary level - see above) section in the table.  Section Helvetica Neue - Lowest grouping of lines.			ļ !
Section Helvetica Neue - Lowest grouping of lines.		Helvetica Neue -	Identifies a secondary (sometimes a primary level - see above) section in the table.
EVIU- 16 VII		Helvetica Neue - Bold- 12 pt.	Lowest grouping of lines.

Symbol/ colour	<u>Purpose</u>	Description and Examples
Line title	Helvetica Neue - Bold- 11 pt.	What is shown in the first column of this line.
Main text	Helvetica Neue - 10 pt.	The section main text uses that font. If a key or code concept is included it uses the following fonts.
Keys	Courier - Bold - 11 pt.	To make key bindings, like <b>C-M-u</b> , stand out.
Code Concepts/ Keywords	American Typewriter, bold, 10 pt.	To make code concepts, keywords or lexical elements stand out like <b>if</b> , <b>#define</b> , <b>#error</b> , {, }, >>, etc
Names	PEL Code Naming Conventions	
pel-	'public' function or command	A PEL function or interactive command that can be executed from anywhere.
pel	'private' function	A PEL function that should not be used externally; these are meant to be used only by appropriate PEL code.
pel-∑-	public <sup>,</sup> <u>hydra</u> command	These are 'public' commands that can be used anywhere. The ∑ symbol is used instead of the word 'hydra' in command names to shorten them a little. This helps showing a larger portion o the command name when the prefix key is typed and which-mode shows the list of commands in the minibuffer.  • ⊌ Under macOS, typing ∑ is done using the ∑w key combination.  • Note that when Emacs runs in terminal mode you can use ೫ ∑o to switch the meaning of the ∑ key between Option and Meta.
