File Management

		LIIE IVI	lanagement 		
<u>Operation</u>	Keystroke Function		Note es (Emacs documentation uses the term "finding" files for that), saving files searching for files or files.		
File Management See also: • <u>M Dired</u> • <u>Customize</u>	content, displaying directory content, etc These are listed in this table. • The directory editing (dired) commands are mainly listed in the MDired table. • There are also several Emacs internal and external packages that provide useful commands. PEL supports several of them, and activates them via customize user option variables. They are listed below. Use Emacs customize system to modify their values to activate, deactivate and modify the behaviour of these packages. PEL provides the <f11> <1> f key binding to quickly gain access to the appropriate customize group where you can change their values. Once you have modified the values, save them and then either execute M-x pel-init or restart Emacs.</f11>				
Open this PDF file. See also: <u>Nelp/Info</u>	<f11> f <f1> 1</f1></f11>	(pel-help-pdf &optional OPEN-WEB-PAGE)			
PEL File/Directory Management See also: <u>Customize</u>	<f11> f <f2> 1</f2></f11>	(pel-customize-pel &optional OTHER-WINDOW)	Customize PEL support for file management. • If OTHER-WINDOW is non-nil (use C-u), display in other window.		
Customize Emacs support for file management	<f11> f <f3> 1</f3></f11>	(pel-customize-library &optional OTHER-WINDOW)	Customize Emacs support for file management.		
Customize Emacs support for file revert	<f11> f r <f3></f3></f11>	(pel-customize-library &optional OTHER-WINDOW)	Customize Emacs support for file automatic revert management.		
Customize ffap (find file at point)	<f11> f a <f3></f3></f11>	(pel-customize-library &optional OTHER-WINDOW)	Customize Emacs support for management of ffap (find file at point).		
Open application	The following comman	nds open OS level applications			
Open currently file visited in current buffer with the default OS application. See also: Molired	<f11> f F</f11>	(pel-open-in-os-app &optional ENAME)	Open the file with the OS-registered application.		
Opening file	The following commands are available to open/visit files in Emacs buffers. For some of them the corresponding ido mode function is also shown. Note: Emacs uses the word "visiting" instead of "opening" files. The command used to 'visit' a file, find-file is Emacs default. It supports Emacs' basic tab completion. Packages that support other completion mechanisms can be installed and activated and then the command uses a different completion mechanism. PEL customization system allows you to specify whether you want to use one or several other completion mechanisms. It also has a command to change the completion mechanism dynamically. You can change it without restarting Emacs or event re-executing pel-init. See the Completion/Input and Customize tables for more info.				
File Lock Protection	Emacs protects against multiple processes modifying the same file with a lock. If you attempt to edit the buffer of a locked file, or save a buffer of a locked file, Emacs will prompt. You can then: • steal the lock (with 's'), • proceed ('p') to edit the file anyway or • quit ('q').				
Open file using OS file- open dialog	%-0	(ns-open-file-using-panel)	6 On macOS in graphics mode only: open a file, select the file name via an OS File dialog.		
Open (visit) a file/directory See also:	C-x C-f	(find-file FILENAME &optional WILDCARDS) (ido-find-file)	Prompt for the file or directory name to open. Open the selected file/directory in a buffer with the appropriate mode. For directory, the buffer opens in Dired-mode.		
- ∑Completion/Input - ∑M Dired - ∑ Customize	 This can be replaced by the ido-mode by the ido-find-file: it provides suggestions. When ido mode is used, you can also: Type C-f or C-x f to change to original find-file mode and prevent Ido completion from trying to provide the name of an existing file when you want to specify the name of a file that does not exists yet. Type C-j to accept the file/directory name verbatim without replacement or suggestion. This is often useful to open a directory in directory editing (dired) mode. To open a file in read-only mode you can: Use one of the commands below (C-x C-x, etc) Use C-x C-f then type C-x C-q to change the mode of the buffer to read-only mode. PEL supports dynamic selection of completion input that control the way this command operates to help you select a file name: (ido, ivy, helm). 				
Open another file in buffer	C-x C-v	(find-alternate-file FILENAME & optional WILDCARDS) (ido-find-alternate-file)	Kills buffer and open the newly specified file in a new buffer same window. When ido-mode is used, the ido-find-alternate-file is used instead. Useful when just selected an empty file just selected by mistake.		
Open file in other window	• C-x 4 f • <f11> f o</f11>	(find-file-other-window FILENAME & optional WILDCARDS) (ido-find-file-other- window)	Edit file FILENAME, in another window. Like C-x C-f, but creates a new window or reuses an existing one.		
Open file in other frame	C-x 5 f	(find-file-other-frame FILENAME & optional WILDCARDS) (ido-find-file-other-frame)	Edit file FILENAME, in another frame. Like C-x C-f, but creates a new frame or reuses an existing one.		
Open in read-only	The following commands open files in read-only mode. While in read-only mode, use Use C-x C-q to permit editing.		While in read-only mode, use Use C-x C-q to permit editing.		
Open a file in read-only mode	C-x C-r	(find-file-read-only FILENAME & optional WILDCARDS) (ido-find-file-read-only)	Edit file FILENAME but don't allow changes. Like C-x C-f, but marks buffer as read-only. Use C-x C-q to permit editing.		
Open file in other window in read-only mode	• C-x 4 r • <f11> f 0</f11>	(find-file-read-only-other-window FILENAME & optional WILDCARDS) (ido-find-file-read-only-other-window)	(find-file-read-only-other-window FILENAME &optional WILDCARDS) Edit file FILENAME in another window but don't allow changes. Like C-x C-f, but marks buffer as read-only. Use C-x C-q to permit editing.		
Open Literally	Open a file with no end	coding conversion			
Visit a file literally: with no encoding support and conversion	<f11> f M-1</f11>	(find-file-literally FILENAME)	Visit file FILENAME with no conversion of any kind. Format conversion and character code conversion are both disabled, and multibyte characters are disabled in the resulting buffer. The major mode used is Fundamental mode regardless of the file name, and local variable specifications in the file are ignored. Automatic uncompression and adding a newline at the end of the file due to 'require-final-newline' is also disabled. If Emacs already has a buffer which is visiting the file, this command asks you whether to visit it literally instead.		
Open binary	Open a file in hex bina	ry mode. There are also comman	ds to convert current buffer to hexadecimal editing, like nhexl. See <u>N Buffers</u> .		
Open a file in hexl-mode See also: <u>∑ Buffers</u>	<f11> f M-x</f11>	(hexl-find-file FILENAME)	Edit file FILENAME as a binary file in hex dump format, using the 'hexl-mode'. • Switch to a buffer visiting file FILENAME, creating one if none exists.		

Operation	Keystroke	Function	<u>Note</u>	
Recently opened	When the pel-use-recentf user option is set to t , Emacs remembers the list of recently opened files. The menu bar includes a File->Open Recent menu entry. Some other functions are activated by their respective user options.			
Open recently opened files, listed with Ido	<f11> f f</f11>	(ido-recentf-open)	Open file. Prompt suggests recently opened files wit Ido-style completion. • Type <tab> to get possible expansions listed in a separate buffer. • Available only when both pel-use-ido and pel-use-recentf are set to t. Credits: Mickey Petersen recentf article.</tab>	
Open recently opened files, listed with Counsel	<f11> f R</f11>	(counsel-recentf)	List files recently opened in a counsel buffer. • The list of recently opened files are listed in a Counsel buffer. Select one and type return to open. • Type C-c C-o to copy the list of files inside a special buffer. • Requires livy mode completion with Counsel mode and recent factivated:	
Edit list of recently opened files	<f11> f M-r</f11>	(recentf-edit-list)	Show a dialog to delete selected files from the recent list. Use it to remove some of the files from the list.	
Open file at point	The following comman	ds, followed by the flap command	ds, allow opening files from the file name taken at point (the cursor location).	
Open file or web-page whose name is at point ★★	• C-^ • <f11> f . • <u>6y</u></f11>	(pel-open-at-point &optional N)	Open the file, library or the URL, named at point, with potential line & column #s. With PEL, the 6y key-chord is available if pel-use-key-chord is non-nil. Command prefixes are supported with the key-chord. See Key-Chords.

Open filename at point in a browser See also:	• <f11> f / • 6u</f11>	able in the command's help docstring. (pel-browse-filename-atpoint) Open the file name at point inside the system's browser. • If point is at a directory name, open the systems application that browses directories (eg. macOS Finder, Windows Explorer). It is easier to ty		
Open URL at point in a browser See also: •	• <f11> f M-/ • 7u</f11>	(browse-url-at-point &optional ARG)	and PEL assigns its own key-chord for it. Ask a WWW browser to load the URL at or before point. Variable 'browse-url-browser-function' says which browser to use. Optional prefix argument ARG non-nil inverts the value of the option 'browse-url-new-windoflag'. PEL provides the <f11> <f2> E u key sequence to open the browse-url group that contains relevant the user options.</f2></f11>	
ffap commands	numbers, does not suphowever support other PEL activates the Ekey bindings shown be When pel-use-ffap dired commands. T	port identifying a window with cor r facilities and can be installed to r Emacs built-in ffap library when the elow. It is set to ffap-bindings, then PEL	The ffap command is similar to pel-find-file-at-point-in-window but does not support line and ommand arguments and is not designed to support multiple programming languages. It does replace the behaviour of standard file management command bindings such as C-x C-f. he pel-use-ffap user option is set to either t or to ffap-bindings. In both cases these activate the also activates the standard ffap bindings which take over the behaviour of the main file finding and re no longer available for these commands.	
Find file/URL at point	<fl1> f a p</fl1>	(ffap &optional FILENAME)		
Find file/URL at point - read only	<f11> f a P</f11>	(ffap-read-only)	Like 'ffap', but mark buffer as read-only.	
Find another file/URL at point in window	<f11> f a v</f11>	(ffap-alternate-file)	Like 'ffap' and 'find-alternate-file': kills current buffer and open new file in the same window.	
Find file/URL in other window	<f11> f a w</f11>	(ffap-other-window)	Like 'ffap', but put buffer in another window.	
Find file/URL in other frame	<f11> f a f</f11>	(ffap-other-frame)	Like 'ffap', but put buffer in another frame.	
Find file/URL in other window - read only	<f11> f a W</f11>	(ffap-read-only-other- window)	Like 'ffap', but put buffer in another window and mark as read-only.	
Find file/URL in other frame - read only	<f11> f a F</f11>	(ffap-read-only-other-frame)	Like 'ffap', but put buffer in another frame and mark as read-only.	
Start Dired with file at point	<f11> f a d</f11>	(dired-at-point &optional FILENAME)	Start Dired, defaulting to file at point. See 'ffap'.	
Start Dired with file at point in other window	<f11> f a D</f11>	(ffap-dired-other-window)	Like 'dired-at-point', but put buffer in another window.	
		1		

Operation

Keystroke

Function

<u>Note</u>

<u>Operation</u>	Keystroke	Function	<u>Note</u>		
Start Dired with file at point in other frame	<f11> f a M-d</f11>	(ffap-dired-other-frame)	Like 'dired-at-point', but put buffer in another frame.		
List directory of file at point	<f11> f a 1</f11>	(ffap-list-directory)	Like 'dired-at-point' and 'list-directory'.		
Open a menu of all files, URL in current buffer.	<f11> f a m</f11>	(ffap-menu &optional RESCAN)	Put up a menu of files and URLs mentioned in this buffer. Then set mark, jump to choice, and try to fetch it. The menu is cached in 'ffap-menu-alist', and rebuilt by 'ffap-menu-rescan'. The optional RESCAN argument (a prefix, interactively) forces a rebuild. Searches with 'ffap-menu-regexp'.		
Open <u>Dired</u> (Directory Editor)	When "opening" (visiting) a directory Emacs opens a buffer in Dired mode, that looks like a ls -l output, which allows several operations. If you specify a directory path to Cx C-f then Dired-mode is used. You can also use the following commands to open buffer in Dired mode. It's also possible to browse a file directory tree with file tree browsers, like NeoTree and Ztree, described below in this table. The Speedbar can also be used.				
Open a directory editor See also: M Dired	• C-x d • % -D	(dired DIRNAME &optional SWITCHES) (ido-dired)	Opens a Dired-mode buffer on the specified directory. Prompt for the directory name. PEL activates ido when the pel-use-ido-mode user option is set to t .		
Run Dired in other (next) window	C-x 4 d	(dired-other-window)	Opens a Dired-mode buffer on the specified directory inside another window. Prompt for the directory name.		
List Directory	C-x C-d	(list-directory DIRNAME &optional VERBOSE)	Display a list of files in or matching DIRNAME, a la 'ls'. DIRNAME is globbed by the shell if necessary. Prefix arg (C-u) means supply -I switch to 'ls'.		
Activating URLs to open files	active use C-c RET or		rog-mode that turn URLs found in the current buffer into clickable buttons. Once the mode is lif the URL is an email address a buffer to write an email to that address opens. If the URL is a pen the address.		
Toggle goto-addr-mode	<f11> f u</f11>	(goto-address-mode &optional ARG)	Minor mode to buttonize URLs and e-mail addresses in the current buffer. With a prefix argument ARG, enable the mode if ARG is positive, and disable it otherwise.		
Toggle goto-addr-prog- mode	<f11> f U</f11>	(goto-address-prog-mode &optional ARG)	Like 'goto-address-mode', but only for comments and strings.		
Open the URL (email or web page)	C-c RET	(goto-address-at-point &optional EVENT)	Send to the e-mail address or load the URL at point. Send mail to address at point: Find e-mail address around or before point. Then search backwards to beginning of line for the start of an e-mail address. If no email address is found there, then load the URL at or before point.		
Insert text of another file at point	The following comman	ds can be used to insert text from	n other files at point in the current buffer.		
Insert file at point	• C-x i • <f11> f i</f11>	(insert-file FILENAME) (ido-insert-file)	Insert contents of file FILENAME into buffer after point. • Set mark after the inserted text.		
Insert file literally at point	<f11> f I</f11>	(insert-file-literally FILENAME)	Insert contents of file FILENAME into buffer after point with no conversion. • Set mark after the inserted text.		
Write text into specified file	The following commands can be used to write text selected from current buffer into specified file.				
Write region text to file	<f11> f w</f11>	(write-region START END FILENAME &optional APPEND VISIT LOCKNAME MUSTBENEW)	Write current region into specified file. • Prompts for the specified file.		
Append region text to file	<f11> f W</f11>	(append-to-file START END FILENAME)	Append the contents of the region to the end of file FILENAME. • Prompts for the specified file.		
Set file mode	<f11> f m</f11>	(set-file-modes FILENAME MODE)	Set mode bits of file named FILENAME to MODE (an integer). Only the 12 low bits of MODE are used. Prompts for file name and then for chmod-like file mode value.		
Reverting Files	If the file's content changed on the disk and you want to refresh the Emacs buffer visiting that file, you need to "revert" the file. • If you want to use Emacs to monitor the content of a file that is continuously modified by an external process (like a log file) set the <i>revert-without-query</i> variable to a list of regular expressions describing the field it'll apply to. • You can also activate the auto-revert mode for the current buffer or globally and restart its timer.				
Revert a buffer	• <f11> f r f</f11>	(revert-buffer &optional IGNORE-AUTO NOCONFIRM	Replace current buffer text with the text of the visited file on disk. • This undoes all changes since the file was visited or saved.		
See also: <u>∑ Diff & Merge</u>	• %−u	PRESERVE-MODES)	 With a prefix argument, offer to revert from latest auto-save file, if that is more recent than the visited file. This is also the command to use to reload a file that was modified on the file system. You can use ediff-current-file to see the difference between the buffer and its disk file. PEL binding for this is <f11> e b f.</f11> 		
Toggle auto-revert mode	<f11> f r a</f11>	(auto-revert-mode &optional ARG)	Toggle reverting buffer when the file changes (Auto-Revert Mode). With a prefix argument ARG, enable Auto-Revert Mode if ARG is positive, and disable it otherwise. • Auto-Revert Mode is a minor mode that affects only the current buffer. When enabled, it reverts the buffer when the file on disk changes. • When a buffer is reverted, a message is generated. This can be suppressed by setting 'auto-revert-verbose' to nil.		
Toggle auto-revert tail mode	<f11> f r t</f11>	(auto-revert-tail-mode &optional ARG)	 Toggle reverting tail of buffer when the file grows. With a prefix argument ARG, enable Auto-Revert Tail Mode if ARG is positive, and disable it otherwise. When Auto-Revert Tail Mode is enabled, the tail of the file is constantly followed, as with the shell command 'tail -f'. This means that whenever the file grows on disk (presumably because some background process is appending to it from time to time), this is reflected in the current buffer. You can edit the buffer and turn this mode off and on again as you please. But make sure the background process has stopped writing before you save the file! 		
Cancel/restart auto-revert timer	<f11> f r SPC</f11>	(pel-auto-revert-set-timer)	 Restart or cancel the timer used by Auto-Revert Mode. If such a timer is active, cancel it. Start a new timer if Global Auto-Revert Mode is active or if Auto-Revert Mode is active in some buffer. Restarting the timer ensures that Auto-Revert Mode will use an up-to-date value of 'auto-revert-interval' (which is normally 5 seconds by default). : pel-auto-revert-set-timer is a thin wrapper over auto-revert-set-timer that displays a warning if executed when the buffer is not already in auto-revert-mode. It also displays the value of auto-revert-interval when auto-revert-set-timer is executed. 		

<u>Operation</u>	Keystroke	Function			<u>Note</u>			
Saving Files		mands to save the cont			are activated via an action associate DEL	and con		
	PEL supports the following controllable actions on file save. Each of these actions are activated via an action-specific PEL user-option, and can temporarily be disabled with a command for the file in the current buffer. The actions and their associated user-option and command are listed here:							
	Action Delete trailing space Update time stamp Update copyright no	e and lines on save pon save	oel-delete-	user-option trailing-whitespace -time-stamp -copyright	Overriding command pel-toggle-delete-trailing-space-on-save pel-toggle-update-time-stamp-on-save pel-toggle-update-copyright-on-save	Key Sequence <f11> M-W <f11> M-T <f11> M-C</f11></f11></f11>

<u>Operation</u>	<u>Keystroke</u>	Function	Note	
View Directory Tree	The NeoTree extern	nal package provides a Vim-NerdT	Tree like tree-view of a directory with expansion/collapse.	
with NeoTree	• <f11> B N < • <f11> B N < • <f11> B N < There is only one N loons used in the tr • In text mode se • In graphics mo</f11></f11></f11>	et pel-neotree-font-in-terminal to arrows to use arrows instead of '+'. de, if pel-neotree-font-in-graphics is set to icons then the icons provided by all-the-icons package is used. er, once PEL has installed the package it does not install the fonts.		
		1.	executing: M-x all-the-icons-install-fonts	
View directory tree with NeoTree	<f11> B N N</f11>	In the NeoTree buffer the following keys are available: • n next line, p previous line. • > end of buffer, < top buffer • SPC or RET or TAB: Open current item if it is a file, Fold/Unfold current item if it is a directory. • U Go up a directory • g Refresh • A Maximize/Minimize the NeoTree Window • It Toggle display hidden files. Controlled by neo-hidden-regexp-list user option. • O Recursively open a directory • C-c C-n Create a file or create a directory if filename ends with a '/' • C-c C-d Delete a file or a directory.		
		 C-c C-r Rename a file or a C-c C-c Change the root di C-c C-p Copy a file or a dire 	rectory.	
Open NeoTree for dir of current buffer	<f11> B N F</f11>	(neotree-find &optional PATH DEFAULT-PATH)	Open a NeoTree window using the directory of the current buffer. No prompt.	
Open NeoTree for specified directory	<f11> B N D</f11>	(neotree-dir PATH)	Prompt for a directory. Open a Neotree window for that directory.	
Close NeoTree window	<f11> B N H</f11>	(neotree-hide)	Close the NeoTree window.	
Show NeoTree window	<f11> B N S</f11>	(neotree-show)	Show the NeoTree window.	
View Directory Tree with ZTree	The <u>ztree external package</u> provides a text-based tree-view of a directory with expansion/collapse. PEL ztree customization: • <f11> B <f2> opens the PEL customization group (select the tree subgroup) . See also: Customize. • Well PEL activates it when pel-use-ztree is set to t. • Modify one of the following PEL provided customization user options: • pel-ztree-dir-move-focus : set to t to move focus to new entry when <ret> is typed. • pel-ztree-dir-filter-list : add a list of regexp to ignore more file. Do not enter quote for string. For example, to ignore the .pyc files, enter ^.*pyc on a line. • pel-ztree-show-filtered-files : set to t to display filtered files until H is typed. Normally they are not shown until H is typed. • <f11> B <f3> prompts, select ztree to open the ztree customization group itself. 1. Execute M-x pel-init after settling and applying new values to activate the new values.</f3></f11></ret></f2></f11>			
View directory as tree with ztree-dir	<f11> B Z</f11>	(ztree-dir PATH)	Open an interactive buffer with the directory tree of the PATH given. → Opens the tree buffer in the current window. → There can be several buffers with different ztree-dir trees.	
		In the Ztree Dir buffer the following keys are available: • >: narrow/display directory on current line		
Searching/Finding Files		wing commands can be used to search for file by name or content. eo: .Emacs #6 : searching and finding files.		
Run grep via find See also: <u>▼ Grep</u>	• <f11> f g • <f11> g f</f11></f11>	(find-grep COMMAND-ARGS)	Run grep via find, with user-specified args COMMAND-ARGS. Collect output in a buffer. While find runs asynchronously, you can use the C-x command to find the text that grep hits refer to. This command uses a special history list for its arguments, so you can easily repeat a find command.	
Search for file with locate	<f11> f L</f11>	(locate SEARCH-STRING &optional FILTER ARG)	Prompt for a search pattern and search for filenames using the system locate command line utility through the sell to search a database of all pathnames that match the specified search pattern. The database is recomputed periodically. • The search result is shown in a '*Locate*' buffer. • With prefix arg ARG, prompt for the exact shell command to run instead. This way you can specify options to the locate command line utility. ■ Use man to get more information on locate (< f11> x m locate)	
Search for files with 'find' and open Dired buffer	<f11> f d</f11>	(find-dired DIR ARGS)	Prompts for the root to search from, and a find command to search for files with the Unix find. • Specify the arguments for the <u>find command</u> . For example, to perform a case insensitive search for all .h files: -iname "*\h" for all .h files. • Opens a Dired-mode buffer and show the files found in there.	
Search directory for files and open Dired buffer for those	<f11> f n</f11>	(find-name-dired DIR PATTERN)	Search DIR recursively for files matching the globbing pattern PATTERN, and run Dired on those files. PATTERN is a shell wildcard (not an Emacs regexp) and need not be quoted. The default command run (after changing into DIR) is: findname 'PATTERN' -ls	
Find files in a directory and open Dired output	<f11> f h</f11>	(find-grep-dired DIR REGEXP)	Find files in DIR that contain matches for REGEXP and start Dired on output. The command run (after changing into DIR) is: find . \(\) -type f -exec 'grep-program' 'find-grep-options' -e REGEXP \(\} \) \\ \) -ls where the first string in the value of the variable 'find-ls-option' specifies what to use in place of "-ls" as the final argument.	
Find Emacs Lisp files in	<f11> f 1</f11>	(find-lisp-find-dired DIR	Find Emacs Lisp files in DIR, matching REGEXP. Open *Find Lisp Dired* buffer on output.	
directory tree	_	REGEXP)
