Scrolling

<u>Description</u>	<u>Keystroke</u>	Function	<u>Note</u>		
Scrolling O GUI-Emacs scroll bars Recenter text in window Vertical scrolling Smooth scrolling Scroll full screen Scroll lock mode PEL window scrolling hydra, vertical & multiwindow vertical scroll Horizontal scrolling Auto-revert tail mode	Emacs supports both <i>vertical</i> and <i>horizontal</i> scrolling, even when Emacs is running in text mode. In GUI mode Emacs has scroll bars you can use. Emacs has several vertical scroll modes and several global variables to control scrolling behaviour as described in the <u>Textual Scrolling</u> page. • Single window scroll, where the navigation commands for up and down are translated to scroll operations when scroll is possible. • Dual window scroll, implemented by the PEL package, where a PEL scroll command in one window is reflected in the other, associated window. • The scroll-all-mode, where all windows are scrolled together when one of the native Emacs scroll commands is used. • Emacs also has the <u>Follow Mode</u> , described at the bottom of this document. See <u>PEL binding for follow-mode</u> . PEL also provides 1-line scroll commands. Note that when Emacs is running in Terminal (TTY) mode, mouse scrolling is normally disabled. • PEL activates the ability to scroll with the mouse in terminal mode when the xterm-mouse-mode is activated (it can be enabled by <f11><f12>). See also: Mouse</f12></f11>				
Open this PDF file. See also: <u>Nelp/Info</u>	<f11> <f1></f1></f11>	(pel-help-pdf &optional OPEN-WEB-PAGE)	Open the <u>∑ Scrolling</u> local PDF. If the prefix argument (like C-u or M) is used, then it opens the remote GitHub hosted raw PDF instead. If the pel-flip-help-pdf-arg user-		
∑ Customize PEL Scrolling control	<f11> <f2></f2></f11>	(pel-customize-pel &optional OTHER-WINDOW)	option is set it's the other way around. Customize PEL Scrolling support. • If OTHER-WINDOW is non-nil (use C-u), display in other window.		
∑ Customize Emacs Scrolling control	<f11> <f3></f3></f11>	(pel-customize-library &optional OTHER-WINDOW)	Customize Emacs Scrolling support groups: frame, follow, smooth-scrolling.		
GUI Scroll bars	Emacs running in graphical	mode supports vertical and horiz	contal scroll bars.		
Toggle Vertical scroll bar on all frames	<f11> B V</f11>	(scroll-bar-mode &optional ARG)	Toggle vertical scroll bars on all frames (Scroll Bar mode). • This applies to all frames that exist, as well as new frames to be created in the future.		
Toggle Vertical scroll bar on current frame	<f11> B v</f11>	(toggle-scroll-bar ARG)	Toggle whether or not the selected frame has vertical scroll bars. • With ARG, turn vertical scroll bars on if and only if ARG is positive. The variable 'scroll-bar-mode' (in the frame customize group) controls which side the scroll bars are on when they are turned on; if it is nil, they go on the left.		
Toggle Horizontal scroll bar mode on all frames	<f11> B H</f11>	(horizontal-scroll-bar-mode &optional ARG)	Toggle horizontal scroll bars on all frames for Emacs running graphics mode . • This command applies to all frames that exist and frames to be created in the future. • If the prefix argument is positive, enable the mode, zero or negative, disable the mode.		
Toggle Horizontal scroll bar on current frame	<f11> B h</f11>	(toggle-horizontal-scroll-bar ARG)	Toggle whether or not the selected frame has horizontal scroll bars. • With ARG, turn horizontal scroll bars on if and only if ARG is positive.		
Recentering in current window	The following command is not a scrolling operation but can help reposition buffer. It can be quite useful to quickly position the line where the cursor is located to the centre, top or bottom of the window, effectively quickly 'scrolling'.				
Position current line to window's Center / Bottom / Top . Refresh screen.	• C-1 • <f11> C-1 • <numkeypad 5=""></numkeypad></f11>	(recenter-top-bottom &optional ARG)	Without argument: moves the current line to window: center -> top -> bottom. The <5> key on numeric keypad can also be used when available and active. See Numkeypad for more information on how to control access to this.		
	• → center → bottom → center → top With arg 0: top first: • M-0 C-1 C-1 C-1 • → top → bottom → center • With numeric positive: move current line to window top position N • With negative numeric: move current line to bottom window position: -1 := last line • PEL provides the <f11> C-1 key binding because some modes use C-1 as a prefix key.</f11>				
Vertical Scrolling	Emacs default vertical scrolling mechanism makes the screen jumps about the size of half a window when the cursor gets close to the top or the bottom of the window. This mode was originally designed to reduce processing requirements. See the following sections of the programming manual for info: • Textual Scrolling • Vertical Fractional Scrolling				
Smooth Scrolling	If you find the behaviour of vertical scrolling annoying, you can activate a smooth scrolling. The smooth-scrolling package provides the smooth-scrolling external package that makes Emacs provide a much smoother scrolling experience. PEL activates smooth scrolling when the pel-use-smooth-scolling user option is set to t . Turn it on or off with the following command.				
Toggle smooth scrolling mode	<f11> s</f11>	(smooth-scrolling-mode &optional ARG)	Toggle smooth scrolling mode on/off. If a numeric argument is used, a positive one turn smooth scrolling on while a negative one turns it off. Requires the smooth-scrolling package. Actvated by pel-use-smooth-scrolling		
Scroll full screen	Emacs provides the following standard commands to scroll text in the current window. These commands scroll without having to enable a special scroll mode (just as the PEL provided single line scroll commands below). However that also work in the single window scroll and the scroll all mode.				
Scroll up by near full screen	• C-v • <page-down></page-down>	(scroll-up-command &optional ARG)	Use an argument number (M-number) before the C-v to specify the number of lines to scroll. In cua-mode, C-v is used for paste. With PEL, if pel-with-cua-paste user option is set to t, C-v is bound to yank, otherwise it uses Emacs default (used for scroll).		
Scroll down by near full screen	• M-v • <page up=""></page>	(scroll-down-command &optional ARG)	Use an argument number (M-number) before the C-v to specify the number of lines to scroll		
Scroll lock mode			 keys. Also keys that normally move point by line or paragraph will scroll the buffer by the cally fixed relative to window boundaries during scrolling. 		
• 1 Window Scroll	The single window scroll mo	de allows using normal cursor mo	ovement keys to scroll the window.		
Toggle Scroll-Lock Mode	<f11> 1</f11>	(scroll-lock-mode &optional ARG)	Toggle single window scroll mode. A buffer-local minor mode for pager-like scrolling. • With prefix argument ARG, a positive argument enables it, a negative disables it.		
All Windows Scroll	In this mode all visible windo	_	I=		
Toggle Scroll All Mode	<f11> a</f11>	(scroll-all-mode &optional ARG)	Toggle shared scrolling in same-frame windows (Scroll-All mode). • With prefix argument ARG, a positive argument enables it, a negative disables it.		
Scroll other window	The other window is the nex	nabled, scrolling commands involute twindow in the list of windows distributed in the line of that the line of that			
Scroll other window up by ~ 1 full window	Esc <pgdown> C-M-v</pgdown>	(scroll-other-window &optional ARG)	Scroll the text of the <i>other</i> window one near-full window down (toward the bottom of the buffer). • If a number argument is specified, that identifies the number of lines to scroll. • A negative argument inverses the direction.		
Scroll other window down by ~ 1 full window	• Esc <pgup> • C-M-S-v</pgup>	(scroll-other-window-down &optional LINES)	Scroll the text of the <i>other</i> window one near-full window up (toward the top of the buffer). • If a number argument is specified, that identifies the number of lines to scroll. • A negative argument inverses the direction.		

supports multi-window grant of the sync-scroll sprough with the pell-toggle-scroll-type, pel-add-window part of the sync-scroll group with the pell-toggle-scroll-sync, pel-add-window that are part of the sync-scroll group with the pell-toggle-scroll-sync pel-add-window-from-scroll-sync commands. The first one creates a set of 2 windows the current one and its next window. Control the set of windows that are part of the sync-scroll set will scroll together only when the pell-scroll-down commands are used, in any major-node. Hydra for scrolling: I horizontal 1-odurn of the sync-scroll set will scroll together only when the pell-scroll-down commands are used, in any major scroll the scroll down commands are used. Description	<u>Keystroke</u>	Function	<u>Note</u>		
Follow Mode	Emacs has a scroll all windows mode which applies all scroll commands to all visible windows. To support mouse wheel or scroll bar you need to implement extra code as suggested by the Emacs Wiki Scroll All Mode page.				
See also: <u>S Windows</u>	Text in the first window goes to the bottom and then	continues there.	 When Emacs follow-mode is used on 2 or more windows, these windows show the text of the same buffer spread across these windows that act as a one continuous stream. Follow mode is a minor mode that combines windows into one tall virtual window. This is accomplished by two main techniques: The windows always displays adjacent sections of the buffer. This means that whenever one window is moved, all the others will follow. (Hence the name Follow mode.) Should point (cursor) end up outside a window, another window displaying that point is selected, if possible. This makes it possible to walk between windows using normal cursor movement commands. Follow mode comes to its prime when used on a large screen and two or more side-byside windows are used. The user can, with the help of Follow mode, use these full-height windows as though they were one. 		
Toggle follow-mode See also: <u>∑ Windows</u>	• <f11> f • <f11> w f</f11></f11>	(follow-mode &optional ARG)	Toggle Follow mode. With a prefix argument ARG, enable Follow mode if ARG is positive, and disable it otherwise.		

Scrolling - Reference

Торіс	Note		
Scroll two opened buffers in a split window at the same time	Use scroll-all-mode I got it to work briefly (when (SL) was displayed in the mode line lighter) but have not been able to get it to work ever since. The scroll-lock-mode behaves like it is documenting in the source code; which is just to prioritize scrolling instead of moving point in the lines.
