Scroll down by new full - Page - Board - Pag	Standard Emacs Scroll Commands	Emacs provides the following standard commands to scroll text in the current window. These commands scroll without having to enable a special scroll mode (just as the PEL provided single line scroll commands below). However that also work in the single window scroll and the scroll all mode. With the current implementation they do not scroll both windows in the dual scroll mode provided by PEL.					
Smooth Scrolling Crass deficial combing mechanism makes the screen jumps about the size of fault a vicinov when the currar gets close to the laps or the bottom of the window. The mode was originally designed to reduce processing equaliframents. This behaviour can however be surprising and amonging mode. The smooth-scrolling package provides the amonth-scrolling set package that makes Emacs provide a much smoother scrolling experience. PEL burdets as mooth scrolling when the pel-use-amonth-scrolling set option is set to 1. You can also turn it on or of with the following commands are provided a much smoother scrolling package. 			,				

<u>Description</u>	<u>Keystroke</u>	Function	<u>Note</u>		
Scroll other window up by 1 line	<m-s-f5></m-s-f5>	(pel-scroll-up-other &optional N)	Scroll the text of the <i>other</i> window one line down (toward the bottom of the buffer). • If a number argument is specified, that identifies the number of lines to scroll. • A negative argument inverses the direction.		
Scroll other window down by 1 line	<m-s-f6></m-s-f6>	(pel-scroll-down-other &optional N)	Scroll the text of the <i>other</i> window one line up (toward the top of the buffer). • If a number argument is specified, that identifies the number of lines to scroll. • A negative argument inverses the direction.		
Scrolling left/right	Scrolling horizontally can be useful for very long lines or narrow windows. By default, Emacs disables these commands as they might confuse new users. The first time you try to use it Emacs will prompt, asking whether you want to enable it. If you decide to enable it forever this information will be written inside your customization data.				
scroll window (lines) left	• C-x <	(scroll-left &optional ARG SET-MINIMUM)	Scroll window left. • This command is disabled by default.		
scroll window (lines) right	• C-x > • C- <pgup></pgup>	(scroll-right &optional ARG SET-MINIMUM)	Scroll window right. • This command is disabled by default.		
1 Window Scroll	The single window s	The single window scroll mode allows using normal cursor movement keys to scroll the window.			
Toggle Scroll-Lock Mode	<f11> 1</f11>	(scroll-lock-mode &optional ARG)	Toggle single window scroll mode. This is a buffer-local minor mode for pager-like scrolling. With a prefix argument ARG, enable the mode if ARG is positive, and disable it otherwise. When enabled, keys that normally move point by line or paragraph will scroll the buffer by the respective amount of lines instead and point will be kept vertically fixed relative to window boundaries during scrolling.		
All Windows Scroll	In this mode all visible windows are scrolled together.				
Toggle Scroll All Mode	<f11> a</f11>	(scroll-all-mode &optional ARG)	Toggle shared scrolling in same-frame windows (Scroll-All mode).		
			 With a prefix argument ARG, enable Scroll-All mode if ARG is positive, and disable it otherwise. When Scroll-All mode is enabled, scrolling commands invoked in one window apply to all visible windows in the same frame. 		
Follow Mode	Emacs has a scroll all windows mode which applies all scroll commands to all visible windows. To support mouse wheel or scroll bar you need to implement extra code as suggested by the Emacs Wiki Scroll All Mode page.				
See also: <u>∑ Windows</u>	Text in the first cowindow in goes to the whottom	. it	 When Emacs follow-mode is used on 2 or more windows, these windows show the text of the same buffer spread across these windows that act as a one continuous stream. Follow mode is a minor mode that combines windows into one tall virtual window. This is accomplished by two main techniques: The windows always displays adjacent sections of the buffer. This means that whenever one window is moved, all the others will follow. (Hence the name Follow mode.) Should point (cursor) end up outside a window, another window displaying that point is selected, if possible. This makes it possible to walk between windows using normal cursor movement commands. Follow mode comes to its prime when used on a large screen and two or more side-byside windows are used. The user can, with the help of Follow mode, use these full-height windows as though they were one. 		
Toggle follow-mode See also: <u>N Windows</u>	• <f11> f • <f11> w f</f11></f11>	(follow-mode &optional ARG)	Toggle Follow mode. With a prefix argument ARG, enable Follow mode if ARG is positive, and disable it otherwise.

Торіс	URL	Note
Scroll two opened buffers in a split window at the same time	https://stackoverflow.com/questions/18092100/ scroll-two-opened-buffers-in-a-split-window-at-the- same-time	Use scroll-all-mode I got it to work briefly (when (SL) was displayed in the mode line lighter) but have not been able to get it to work ever since. The scroll-lock-mode behaves like it is documenting in the source code; which is just to prioritize scrolling instead of moving point in the lines.
