ERT — Emacs Lisp Regression Testing

If you write Emacs Lisp code, writing unit test code normally helps increase code quality and maintainability. The ERT library provides a sir powerful, environment to write test you can run from the command line and interactively, inside Emacs with the extra ability to debug failing. See: ##I - Emacs Lisp See: ##I - Emacs Lisp To run the test: load the Emacs Lisp file that defines the tests. With PEL you can use the <f12> 1 for <f12> 1 v key bindings to load-file and per file commands. See ##I - Emacs Lisp for more info. Type M-x ert RET t RET. That executes the ert command described below and provides the selector t which means running every test. You can also use other regular expression that identify the names of the test functions to run (for example use "^foo-" to run all tests name that begins with foo Run test interactively</f12></f12>	g code. with names el-load-visited- that have a uffer. all tests, or nil; they are d how to	
* ERT is part of Emacs standard distribution since Emacs 24. * ERT provides a command to run tests that have been written using the ERT macros. Tests are normally written inside separate .el files, we using the same prefix as the file being tested. **To run the test:* * load the Emacs Lisp file that defines the tests. With PEL you can use the <f12> 1 for <f12> 1 v key bindings to load-file and perfile commands. See file commands. See file commands. See file commands described below and provides the selector t which means running every test. * That executes the ert command described below and provides the selector t which means running every test. * You can also use other regular expression that identify the names of the test functions to run (for example use "Afoo-" to run all tests name that begins with foo **Run test interactively** M-x ert * (ert SELECTOR & optional OUTPUT-BUFFER-NAME MESSAGE-FN) **Run the tests specified by SELECTOR and display the results in a bit of selection is continuated self-tests and specify which buffer to use and display message. **OUTPUT-BUFFER-NAME** and MESSAGE-FN should normally be used for automated self-tests and specify which buffer to use and display message. **By default, the results are stored inside the *ert** buffer, opened in the self-test inside the *ert** buffer, open</f12></f12>	with names el-load-visited- that have a uffer. all tests, or nil; they are d how to	
Using the same prefix as the file being tested. To run the test: • load the Emacs Lisp file that defines the tests. With PEL you can use the <f12> 1 f or <f12> 1 v key bindings to load-file and perfile commands. See £\$I - Emacs Lisp for more info. • Type M-x ert RET t RET. • That executes the ert command described below and provides the selector t which means running every test. • You can also use other regular expression that identify the names of the test functions to run (for example use "^foo-" to run all tests name that begins with foo Run test interactively M-x ert (ert SELECTOR &optional OUTPUT-BUFFER-NAME MESSAGE-FN) Run the tests specified by SELECTOR and display the results in a bit of a second in 'ert-select-tests'. (Use t to run name the test to execute. • OUTPUT-BUFFER-NAME and MESSAGE-FN should normally be used for automated self-tests and specify which buffer to use and display message. • By default, the results are stored inside the *ert* buffer, opened in</f12></f12>	that have a uffer. all tests, or nil; they are d how to	
• load the Emacs Lisp file that defines the tests. With PEL you can use the <f12> 1 for <f12> 1 v key bindings to load-file and perfile commands. See £₱1 - Emacs Lisp for more info. • Type M-x ert RET t RET. • That executes the ert command described below and provides the selector t which means running every test. • You can also use other regular expression that identify the names of the test functions to run (for example use "^foo-" to run all tests name that begins with foo Run test interactively M-x ert (ert SELECTOR & optional OUTPUT-BUFFER-NAME MESSAGE-FN) Run the tests specified by SELECTOR and display the results in a bit of selections in the set of security. • OUTPUT-BUFFER-NAME and MESSAGE-FN should normally be used for automated self-tests and specify which buffer to use and display message. • By default, the results are stored inside the *ert* buffer, opened in the set of the security.</f12></f12>	that have a uffer. all tests, or nil; they are d how to	
file commands. See #NI - Emacs Lisp for more info. Type M-x ert RET t RET. That executes the ert command described below and provides the selector t which means running every test. You can also use other regular expression that identify the names of the test functions to run (for example use "^foo-" to run all tests name that begins with foo Run test interactively M-x ert (ert SELECTOR & optional OUTPUT-BUFFER-NAME MESSAGE-FN) Run the tests specified by SELECTOR and display the results in a bit of selection selection is selected in 'ert-select-tests'. (Use t to run name the test to execute. OUTPUT-BUFFER-NAME and MESSAGE-FN should normally be used for automated self-tests and specify which buffer to use and display message. By default, the results are stored inside the *ert* buffer, opened in	that have a uffer. all tests, or nil; they are d how to	
That executes the ert command described below and provides the selector t which means running every test. You can also use other regular expression that identify the names of the test functions to run (for example use "^foo-" to run all tests name that begins with foo Run test interactively M-x ert (ert SELECTOR & optional OUTPUT-BUFFER-NAME MESSAGE-FN) Run the tests specified by SELECTOR and display the results in a brack of the selection of the test to execute. SELECTOR works as described in 'ert-select-tests'. (Use t to run name the test to execute. OUTPUT-BUFFER-NAME and MESSAGE-FN should normally be used for automated self-tests and specify which buffer to use and display message. By default, the results are stored inside the *ert* buffer, opened in	uffer. all tests, or nil; they are d how to	
Run test interactively M-x ert (ert SELECTOR & optional OUTPUT-BUFFER-NAME MESSAGE-FN) Run test interactively M-x ert (ert SELECTOR & optional OUTPUT-BUFFER-NAME MESSAGE-FN) Run the tests specified by SELECTOR and display the results in a bit of the second of th	uffer. all tests, or nil; they are d how to	
MESSAGE-FN) • SELECTOR works as described in 'ert-select-tests'. (Use t to run name the test to execute. • OUTPUT-BUFFER-NAME and MESSAGE-FN should normally be used for automated self-tests and specify which buffer to use and display message. • By default, the results are stored inside the *ert* buffer, opened in	all tests, or nil; they are d how to

display message. • By default, the results are stored inside the *ert* buffer, opened in		
	n ERT-Results	
ert* buffer commands The following single key commands are available in the *ert* buffer window and used to look into test failures.		
Re-run test r (ert-results-rerun-test-at-point) Re-run the same test		
Jump to test source . (ert-results-find-test-at-point-other-window) Jump to the source code of the test (in another window)	£=11==1	
List should forms 1 (ert-results-pop-to-should-forms-for-test-at-point) Shows the list of all should forms executed during the test before it in the backtrace by the backtrace for the failed test at point b	Talled	
Re-run test with d (ert-results-rerun-test-at-point-debugging-errors) Re-run the same test with debugging enabled		
debugging		
Show messages m (ert-results-pop-to-messages-for-test-at-point) Show what messages were printed before the test failed		
Toggle condition printing L (ert-results-toggle-printer-limits-for-test-at-point) Toggle how much of the condition to print for the test at point. Delete obsolete tests Delete obsolete tests (test whose code might have changed)		
Re-run all tests R (ert-results-rerun-all-tests) Re-run all tests, using the same selector		
Move to the next test n (ert-results-next-test) Move to the next test results.		
result		
Move to previous test results. p		
Jump between summary j (ert-results-jump-between-summary-and-result) Jump between test result and summary. By positioning point on the character (., F or f) and then typing j point will move to the test summary.		
create one if the test passed). From the summary you can easily pre move point to the source code of the test (in another window).		
Show help for test h (ert-results-describe-test-at-point) Get help for the test corresponding to the test result character (or te point.	st summary) at	
Describe available ? (describe-mode &optional BUFFER) commands		
Quit - close window q (quit-window &optional KILL WINDOW) Quit window		
Run Tests in Batch To execute tests from the command line, use Emacs in batch mode to load the specific tests and run them using a ERT function.	To execute tests from the command line, use Emacs in batch mode to load the specific tests and run them using a ERT function.	
Mode • For example: emacs -batch -l ert -l my-tests.el -f ert-run-tests-batch-and-exit ERT provides the following functions:	• For example: emacs -batch -l ert -l my-tests.el -f ert-run-tests-batch-and-exit ERT provides the following functions:	
	(ert-run-tests-batch &optional SELECTOR) • Run the tests specified by SELECTOR, printing results to the terminal. • SELECTOR works as described in 'ert-select-tests', except if SELECTOR is nil,	
in which case all tests rather than none will be run; this makes the line "emacs -batch -l my-tests.el -f ert-run-tests-batch-and-exit" • Returns the stats object.		
Run batch tests and exit (ert-run-tests-batch-and-exit &optional SELECTOR) Like 'ert-run-tests-batch', but exits Emacs when done.		
·	 The exit status will be 0 if all test results were as expected, 1 on unexpected results, or 2 if the tool detected an error outside of the tests (e.g. invalid SELECTOR or bug in the code that runs the tests). 	
Test code is written using forms that use the ert-deftest macro. See the following macro descriptions		
Define a test (ert-deftest NAME () [DOCSTRING] [:expected-result RESULT-TYPE] Define NAME (a symbol) as a test.	mal c	
[:tags BODY is evaluated as a 'progn' when the test is run. It should sig condition on failure or just return if the test passes.		
'should', 'should-not', 'should-error' and 'skip-unless' are usef assertions in BODY.	iul for	
 Use 'ert' to run tests interactively. Tests that are expected to fail can be marked as such using :expe See 'ert-test-result-type-p' for a description of valid values for RE 		
The should macro (should FORM) Evaluate FORM. If it returns nil, abort the current test as failed. • Returns the value of FORM.		
The should-not macro (should-not FORM) Evaluate FORM. If it returns non-nil, abort the current test as failed. • Returns nil.		
error macro (should-error FORM &rest KEYS &key TYPE EXCLUDE-SUBTYPES) Evaluate FORM and check that it signals an error.		
The error signaled needs to match TYPE. TYPE should be a list of names. (It can also be a non-nil symbol, which is equivalent to a containing that symbol.) If EXCLUDE-SUBTYPES is nil, the error if one of its condition names is an element of TYPE. If EXCLUDE-non-nil, the error matches TYPE if it is an element of TYPE. If the error matches, returns (ERROR-SYMBOL. DATA) from the element of the error was signaled, abort the test as failed.	singleton list matches TYPE -SUBTYPES is	
The skip-unless macro (skip-unless CONDITION) Skip the current ert-deftest defined test unless CONDITION is non-round to skip tests when the environment does no necessary conditions for a valid test.		
The :expected-result tag :expected-result		
• :failed • :passed conditions. It can also be used to silence the report of a bug while left test. See the documentation.	eavirig in the
