Perl scripts

Impose strictures in Perl files to prevent errors by adding one of the following use lines. Also see the **strictures package.**

Use the following at the beginning of Perl script files. perldiag @ perldoc	<pre>#!/usr/bin/perl use strict; use warnings; use diagnostics;</pre>	#!/usr/bin/perl -w use v5.12; # loads strict use diagnostics produces more info but increases startup time.	 Most Perl code should also activate the strict Perl ru See: <u>Barewords in Perl</u> 	ules and warnings to detect warnings.				
use version/features	<u>use</u> v5.36;		o enable both the strict and warning pramas as well as several <u>named features</u> . ting the feature bundles per Perl versions.					
Perl 5 Operators								
Perl 5 Operators Note:	C Operators missing from F	perators, listed below with their precedence Perl: unary &, unary * and (type) ators: in Perl quotes are operators and the	e and associativity. y provide various kind of interpolating and pattern matchi	ing capabilities.				
Associativity: one of: right left NA: not associative: cannot use more than one of these operators in sequence. CH: chained	left Arrow Operator NA Auto-increment right Exponentiation: right Symbolic Unary left Binding operato left Multiplicative O left Additive Operat left Shift Operators:	and Auto-decrement:	nd unary + and - Note: The operator \	creates a reference. See example.				
To get this information, use: perldoc perlop	NA named unary op NA Class instance O CH Relational Oper CH/NA Equality Operat left. Bitwise And:	Derator: isa rators: as numbers: <	3 3-	ge 				

				-				1	
left.	Bitwise And:	& &.							
left	Bitwise Or and Exclusive Or:	1 1.	^ ^						
left	C-style Logical And:	&&							
left	Logical Defined-Or:	11 ^	^ //						
NA	Range Operators:	• •	•••						
right	Conditional Operator:	?:							
right	Assignment Operators:	=							
		**=	+=	*=	&=	& .=	<<=	= 3.3	
			-=	/=	=	.=	>>=	=	
			.=	% =	^=	^ .=		//=	

			/ –	-	•	//-	11-	
		.=	% =	^=	^.=		//=	
			x=					
		goto last n	ext re	do dum	o O			
left	Comma, fat-comma Operators:	, =>						
NA	<u>list operators (rightward)</u>							
right	Logical Not:	not.						

	left	Logical And:	and		
	left	Logical or and Exclusive or:	or xor		
	-+-	Converts a string that starts with digit	s into a number.	<pre>print -+- '22les poulets!';</pre>	-+- is essentially - + - or but a + to allow placing
rl	0+			# prints 22	them together. The 0+ does the same as -+-, but
(e					the second has higher precedence

	leit	Logical of and Exclusive or:		
operators, but look like operators: they are concatenation of other operators that achieve a specific effect.	-+- 0+	Converts a string that starts with digits into a number.	<pre>print -+- '22les poulets!'; # prints 22</pre>	-+- is essentially - + - or but a + to allow placi them together. The 0+ does the same as -+-, but the second has higher precedence.
	=()=	Called the 'goatse' operator. It causes the right side expression to be evaluated in array context. Used to assign the array/list size to a scalar.		
	@{[]}	Useful to interpolate an array inside a string.	print "these people @{[get_na	mes()]} get promoted"

operators helps understand Perl. They	Note that: "@{[something]}" is join \$", something		
should not be used in production code.	 Force scalar context.	() returns human readable time, s a 9-tuple with various date	<pre>\$ perl -le 'print ~~localtime' Mon Nov 30 09:06:13 2009</pre>

Truth and falsehood

🛕 a bareword **false** has

context: • the number **0**, A Remember that the the strings '0' and '', strings '0' and " mean false. The output of glob() may return a file named '0'! • the empty list (), "undef" All other values are true.

• False in a boolean Negation of a true value by "!" or "not" So the following scalar values are returns a special false value.

When evaluated as a string it is treated as ", but as a number, it is treated as 0.

considered false:

undef - the undefined value
0 the number 0, even if you write it as 000 or 0.0
• "the empty string.

• '0', a single 0 in the string. one way to define valid true and false constant symbols that can be used in assignments (but see ←): All other scalar values, including the following are true:

1 any non-0 number'' the string with a space in it

'00' two or more 0 characters in a string
"0\n" a 0 followed by a newline

• 'true'

• 'false' . Even the string 'false' evaluates to true.

use constant { true => 1, false => 0 };

Unix).

modification time

a truth value of **true**!!! if (-e \$fname && -f _ && -r _) {
 print("\$fname exists, is readable\n"); } File test operators It is possible to combine the file test operator with the AND operator as in the following example:

The most important	-r	is readable by effective uid/gid	-е	exists.	-b	is a block special file.
operators are shown	-w	is writable by effective uid/gid	-z	is empty.	-с	is a character special file.
here.	-x	is executable by effective uid/gid	-s	has nonzero size (returns size in bytes).	-t	handle is opened to a tty.
They check if the file	-o	is owned by effective uid	-f	is a plain file.	-u	has setuid bit set.
	-R	is readable by real uid/gid	-d	is a directory.	-g	has setgid bit set.
See also:	-W	is writable by real uid/gid	-I	is a symbolic link.	-k	has sticky bit set.
• File Tests 😙	-X	is executable by real uid/gid	-р	is a named pipe (FIFO) or Filehandle is a pipe.	-T	is an ASCII text file (heuristic guess).
• File test operators @	-o	file is owned by real uid.	-S	is a socket.	-В	is a "binary" file (opposite of -T).

Perl 5 Input/Output								

Perl 5 Input/Output

Perl 5 Statements

Loop control	See <u>perlsyn</u> for more information on Perl syntax	which includes declarations, blocks, loops, labels, subrout	ines, etc
Use the <u>last</u> and <u>redo</u> inside a naked block of code to control looping.	loop control keywords: last g: exits the loop. next g: starts the next iteration of the loop. redo g: restarts the loop block without evaluating the condition again.	The last , next, and red loop control keywords work in the following constructs: • while (condition) { } • until (condition) { } • for (init; condition; continue) { } • foreach array { } • naked block: { }	Notes: • The while and foreach loops may have a continue block: executed before evaluating condition again, which corresponds to the 3rd part of a for loop statement. See this @ stackOverflow. • Blocks can be labelled g as targets to last, next, and redo

Statement modifiers	• if EXPR • unless EXPR • while EXPR • until EXPR • for LIST • foreach LIST • when EXPR • do block	The for and foreach statements impose a list context; the complete list is processed. Therefore a loop like the following trying to stop on a line that has "_END_" on it will not work since it reads all of STDIN: foreach (<stdin>) { last if ?_END/; ; }</stdin>	The while statement imposes a scalar context; it takes one line at a time from <stdin> and the following code works properly: while (<stdin>) { last if /_END/; ; }</stdin></stdin>
Conditional statements			

Perl 5 Subroutines

Perl subroutines					
subroutine &	Why we teach the subroutine ampersand Why should I use the & to call a Perl subrouting	ne? @ StackOverflow	Another point of view: <u>Subroutines and Ampersands</u>		
Subroutine Prototypes	An older Perl feature. Clashes with subroutine signatures as of Perl v5.20. In Perl >= v5.20 put the :prototype attribute before subroutine prototype parenthesis.				
Subroutine signatures • Perl >=5.36: Stable • Perl >= 5.20: Experimental See: Use v5.20 subroutine signatures	Exactly zero arguments	()	Zero or 1 argument, no default, unnamed:	(\$=)	
	Zero or 1 argument, no default, named	(\$val=)	Zero or 1 argument, named, with default	(\$val=1)	
	exactly 1 named argument:	(\$val)	Exactly 2 arguments	(\$v1, \$v2)	
	2, 3 or 4 arguments no defaults: (\$v1,	\$v2, \$=, \$=)	2,3 or 4 arguments, 1 default:	(\$v1, \$v2, \$v3='a', \$=)	
	Two or more, any number of arguments.	(\$v1, \$v2, @)	Two or more arguments, remainders into a named array:	(\$v1, \$v2, @rest)	
	Two or more arguments: an even number	(\$v1, \$v2, %)	Two or more arguments, remainders into a named hash:	(\$v1, \$v2, %rest)	
	Class method	(\$class,)	Object method	(\$self,)	
Variables in subroutines	global by default				
	my local, lexical scope, non persistent				
	state Local, lexical scope, persistent	Perl >= v5.10	Restriction: in Perl < v5.28: array and hashes state cannot	be initialized in list context.	
	our creates a lexical scoped alias to a package variable				
	local				
Returned value	The result of the last evaluated expression is i The return operator can be used but it's not re The subroutine can return a scalar in scalar co Inside the subroutine, use the wantarray fully	equired unless used to chontext or a list if called in		e).	

Perl 5 Built-in Functions

Perl Functions Perl syntax	To get information about a Perl function from the command line use the perldoc -f command. To get information about print use: perldoc -f print		
! Cautionary notes			
each keyword is broken Use <u>Var::Pairs</u> instead.	Do NOT use the built-in each. It is broken, as described by <u>Damian Conway</u> in his <u>Modern Perl Best Practice O'Reilly course</u> , section control structure. • each is not re-entrant: • nested loops of each over the same hash does not work as expected and will create infinite loop since the nested loop each juts iterates from where the first loop each left it. • Exiting the loop leaves the state of the each internal pointer at the current location. • If you use each on the same hash later it will resume from where it left, it will not start form the beginning.		

Perl 5 Modules **##**

Perl Modules			
Perl core modules	How to detect where a module is installed: perldoc -1 Module		
Modules @perltutorial do Modules Using simple modules ♂ use	<u>do</u>	Looks for the module file by searching the @INC path. • If Perl finds the file, it places the code inside the calling program and executes it. Otherwise, Perl will skip the do statement silently.	
	require	Loads the module file once. • If the require for the same file appears twice, Perl ignores it. Perl will issue an error message if it cannot find the file.	
	use	Similar to require except that Perl applies it before the program starts. • Therefore the use statement cannot be invoked inside conditional statements such as if-else. Used often to include a module in a program.	

PerlTidy formatting control

perItidy option	Option	Impact
indentation style	-bl, opening-brace-on-new-line brace-left	 Without this option (the default) the code indentation style selected is <u>K&R style</u>. With this option, the indentation style is <u>Allman/BSD style</u>.
