Shells, Terminal Emulators, REPLs & Applications

Description	Keystroke	Function	Note		
Emacs Shells			nning programming language specialized shells and programming language REPL.		
	It provides multiple terminal emulators and shells. There's also several external packages that provide more.				
See also § Shells/	This page describe the command	ls available to start these wheels,	terminal emulators and REPLs inside Emacs buffer windows.		
Terminals Comparisons	Note that inside the term, ansi-term and vterm buffers, all Emacs keys are not always available: these major modes operate in to input modes: • shell input (char) mode: where the shell gets the keys • Emacs input (line) mode: where Emacs key bindings are available. See Shells/Terminals Comparisons for more information.				
Open this PDF file. See also: <u>Nelp/Info</u>	• <f11> SPC SPC z <f1> • <f11> SPC SPC s <f1> • <f11> SPC SPC t <f1></f1></f11></f1></f11></f1></f11>	(pel-help-pdf &optional OPEN-WEB-PAGE)	Open the <u>Shells</u> local PDF. If the prefix argument (like C-u or M) is used, then it opens the remote GitHub hosted raw PDF instead. If the pel-flip-help-pdf-arg user-option is set it's the other way around.		
	<f12> <f1></f1></f12>		The <f12> <f1> key sequence is available in the following major modes: shell-mode,</f1></f12>		
<u>> Customize</u> PEL shell management control	• <f11> SPC SPC z <f2> • <f11> SPC SPC s <f2> • <f11> SPC SPC t <f2></f2></f11></f2></f11></f2></f11>	(pel-customize-pel &optional OTHER-WINDOW)	Customize PEL shell support: term. • If OTHER-WINDOW is non-nil (use C-u), display in other window.		
	<f12> <f2></f2></f12>		The <f12> <f2> key sequence is available in the following major modes: shell-mode,</f2></f12>		
<u>∑ Customize</u> Emacs shell & term control	<f11> SPC SPC z <f3></f3></f11>	(pel-customize-library &optional OTHER-WINDOW)	Customize Emacs shell support: shell, term, terminal, term.		
∑ Customize Emacs shell control	<f11> SPC SPC s <f3></f3></f11>	(pel-customize-library &optional OTHER-WINDOW)	Customize Emacs shell-mode support. • If OTHER-WINDOW is non-nil (use C - u), display in another window.		
	<f12> <f3></f3></f12>		In shell-mode the <f12></f12> <f3></f3> key opens the shell customization group.		
© Customize Emacs shell control See also:	<f11> SPC SPC t <f3></f3></f11>	(pel-customize-library &optional OTHER-WINDOW)	Customize Emacs term-mode support. • If OTHER-WINDOW is non-nil (use C-u), display in another window.		
§ Shells/Terminals Comparisons	<f12> <f3></f3></f12>		In term-mode the <f12> <f3> key opens the term customization group. • ⚠The key sequence is only available in term and ansi-term buffers when the buffer is operating in Emacs (line) input mode. Toggle to line input mode by typing C-c C-j.</f3></f12>		
Launch OS	With the following command you	can launch an operating system	application that will run independently of Emacs.		
Application from Emacs	<f11> A</f11>	(counsel-linux-app &optional ARG)	Launch a Linux desktop application, similar to Alt- <f2>. When ARG is non-nil, ignore NoDisplay property in *.desktop files. On Linux, requires the counsel external package. PEL activates it when the pel-use-counsel user option is set to t.</f2>		
		(counsel-osx-app)	Launch a macOS application via ivy interface. On macOS, requires the <u>counselx-osx-app</u> external package. PEL activates it when the <u>pel-use-counsel-osx-app</u> user option is set to t.		
List Emacs Child Processes	Emacs can run several synchronous and asynchronous processes as child processes. They can be listed, showing the actual command line used to launch them with the following command.				
List processes See also: <u>▼ Help/Info</u>	• <f11> z ? • <f11> ? e C-p</f11></f11>	(list-processes &optional QUERY-ONLY BUFFER)	Display a list of all processes that are Emacs sub-processes. If optional argument QUERY-ONLY is non-nil, only processes with the query-on-exit flag set are listed. Any process listed as exited or signalled is actually eliminated after the listing is made.		
Run Commands in system shell	The following commands can be used to quickly execute an external command inside a system shell process and display the result inside an Emacs buffer. • Use these commands from buffer of any major modes.				
Run a shell command	• M-! • ₩-L	(shell-command COMMAND &optional OUTPUT-BUFFER ERROR-BUFFER)	Prompts for the command in the minibuffer, show the command output in the next window in the *Shell Command Output* buffer in Fundamental mode.		
Run a command on a marked region	м-	(shell-command-on-region START END COMMAND &optional OUTPUT-BUFFER REPLACE ERROR-BUFFER DISPLAY-ERROR-BUFFER)	Execute string COMMAND in inferior shell with region as input. Normally display output (if any) in temp buffer '*Shell Command Output*'; Prefix arg means replace the region with it. Return the exit code of COMMAND. Mark the region first. Then type M-I. Emacs prompts for the command to run. Use an argument to replace the region with the command output (ie. type C-u M-I)		
Run a shell command asynchronously	M-&	(async-shell-command COMMAND &optional OUTPUT-BUFFER ERROR- BUFFER)	Execute string COMMAND asynchronously in background. Like 'shell-command', but adds '&' at the end of COMMAND to execute it asynchronously. The output appears in the buffer '*Async Shell Command*'. That buffer is in shell mode.		
Open a shell or terminal buffer	Several terminal-like shells are available. They can be grouped in 3 categories: 1. eshell. Pure Emacs shell with all commands implemented in Emacs Lisp. Supports Unix style commands in any Operating System. Also support evaluation of Lisp expressions. If you know Emacs Lisp this can be extremely useful. 2. The other classical terminal and shells: shell, ansi-term and term. These all have pros and cons. They run slower than vterm but they are built-in. Of those, the ansi-term has more capabilities. 3. vterm. A relatively new shell for Emacs that is very fast. It's an external package that gets installed by PEL when the pel-use-vterm user option is set to t. Fo running Unix commands this is probably what you will want to use. See its installation information on its row below.				
	Each have pros and cons. See the Shells/Terminals Comparisons document.				
Open an eshell	<f11> z e</f11>	(eshell &optional ARG)	Open an eshell buffer. To open another eshell instance: use the C-u prefix To open a numbered eshell: use the C-u number prefix		
	Implementation: • eshell is implemented in Emacs Lisp and implements several Unix commands, making them available to OS that do not natively have them (like Windows). If a command is not implemented it runs the one found in PATH. Extra Features • Can redirect output into a buffer. The grep command output goes to a grep result buffer which can be used to open the various files. • Support lisp commands. Supports • Cursor lateral cursor line beginning/end, kill, yank. • Meta-cursor word-move keys, but going left it does not stop at the prompt. • command tab expansion, command line re-direction • Is colouring (done by the eshell implementation), columns are aligned. • Command history (and shows history item # in mini-buffer) • Can run top, man, less (which start inside separate buffer) • Can run Python scripts. Limitations: • Meta-cursor word-move keys going left does not stop at the prompt. • Clear screen does not work • No bash alias, however eshell can remember its own aliases and will prompt for commands often ran & unfound.				

<u>Description</u>	<u>Keystroke</u>	Function	<u>Note</u>			
Open a shell	<f11> z s</f11>	(pel-shell)	Opens an inferior shell in the current window or moves point to the *shell* buffer already showing in one of the windows.			
	 Implementation This is the PEL implementation which uses the built-in Emacs shell command and ensures it opens inside the current window, like term, ansi-term, ielm and vterm. The built-in Emacs shell commands creates a window in the other window. This is a surprising behaviour compared to the other inferior process commands and the PEL implementation fixes that. The Emacs shell command is the oldest one. It uses the comint-mode, which makes it quite versatile. Emacs keys are possible, however the sub-process does not see the keys until <ret> is pressed making it unfit for programs that directly read the input.</ret> 					
	 Supports Can run multiple shell, each inside its own buffer/name Cursor lateral cursor line beginning/end, kill, yank. Meta-cursor word-move keys. bash alias Command history (but with Control Up/Down) Can run Python scripts. Can run Python REPL, REPL is OK, echo is OK, no Python colouring, but each command is colored. Can run Common-Lisp (clisp) REPL Limitations: Clear screen does not work. directly but PEL provides the <f12> c or C-c M-o. See below.</f12> Not a good candidate for running UI applications such as top, htop, etc 					
Open an ANSI term shell	<f11> z a</f11>	(ansi-term PROGRAM &optional NEW-BUFFER- NAME)	Normally operates in character mode, in which up/down navigation and kill/yank is not possible. Change to line mode to do that: Use C-x C-j to change to line mode an allow movement, mark, saving. When done use C-c C-k to switch to character mode.			
		Emacs Lisp. rm. within it (vi, emacs, others). But e-char M- <down> ed e, which does not allow movemed to do not work as navigating: used</down>	t use character-mode.			
Open a term shell	<f11> z t</f11>	(term PROGRAM)	Prompts for shell to use. Default is /bin/bash. Can use others. Opens in current window.			
Open a <u>vterm</u> shell	Implementation: Shell implemented in Emacs Lisp. The keys are sent directly to the sub-process, which means they are not interpreted by Emacs. Same access as normal shell: can use the bash alias, tab-autocomplete, clear screen, can use less and indirection, can execute python scripts. Can even run other terminal editors like vim, synaptic, etc Supports Cursor lateral cursor line beginning/end, kill, yank. Meta-cursor keys, but only in terminal Emacs, not in GUI Emacs. Is colouring, columns are aligned bash tab expansion command line redirection clear screen Command history Can run Python scripts. Running Python shell: REPL is OK, echo is OK Limitations: In GUI Emacs: Meta-left/right cursor word move do not work. Use Esc-b and Esc-f here instead. Normal Emacs keystrokes does not always work, it depends on the programs that are executed from the shell. When it stops working, either use C-c b to switch to another buffer or exit the shell to gain control to Emacs keys in this buffer. Vertical cursor history works only with Control-Up and Control-Down Emacs keys with Meta do not work. The ones with Control do work. Can run top in the buffer, but then C-c does not stop it. To stop it split the buffer in 2, kill the buffer with C-x k, confirm, close the buffer.					
open a <u>riemi siicii</u>	Create a new vterm shell. A fast & full-featured *nix-compliant shell. NAME) Create a new vterm shell. A fast & full-featured *nix-compliant shell. Although vterm is relatively new this is the fastest shell. Highly recommended. PEL activates it when the pel-use-vterm user option is set to t. Use C-c C-t to toggle the Vterm-Copy mode which allows navigation and text copy in the buffer. While the buffer is in Vterm mode you cannot use the PEL function keys as they are interpreted by the program running in the vterm shell. All other Emacs leave work. Note: The program running in the vterm shell. All other Emacs leave work. Note: The program running in the vterm shell. All other Emacs leave work.					
	keys work. In Vterm-Copy the function keys are interpreted by Emacs so the PEL function key mappings do work. • A vterm maximum scroll back size (the maximum number of lines the buffer can retain) is limited to 100000 lines. The value used is set by the vterm-max-scrollback user option which defaults to 1000. If you plan to use commands that print a long number of lines, you may want to change this value. • A when using this shell please first read the shell-side-configuration notes					
Shell-mode Commands		The following commands are available in a shell-mode buffer.				
Resync directories. • Use to (re-)activate	<f12> r</f12>	(shell-resync-dirs)	Resync the buffer's idea of the current directory stack.			
tab completion in shell.	 Use this command to allow tab completion at the shell prompt if it does not work. This command queries the shell with the command bound to 'shell-dirstack-query' (default "dirs"), reads the next line output and parses it to form the new directory stack. DON'T issue this command unless the buffer is at a shell prompt. Also, note that if some other subprocess decides to do output immediately after the query, its output will be taken as the new directory stack you lose. If this happens, just do the command again. 					
Clear shell buffer	• <f12> c • C-c M-o</f12>	(pel-comint-clear-buffer- and-get-prompt @optional BUFFER-OR-NAME)	Clear the command interpreter buffer. Ensure the shell is ready to take input. • Useful in the *shell* buffer because the clear shell command does not work. • The C-c M-o binding to the PEL function is local to the buffer. Bindings in buffers with the major modes remain attached to the Emacs built-in comint-clear-buffer command.			

Specialized REPL You can run several read eval nut loop programming shells in Emacs. Several of those REPLs, like lelm and run-python are part of Emacs. PEL makes the other available or adds some functionality to others when the corresponding pel-user-user option variable for the respective language is turned on leat to 1). It is also possible to use shells to run other PEPL programs directly from an embedded terminal shell like veterm (see above). The command for the finess Lisp REPL, lelm, is accessible via the pelregal key prefix ⟨≤11⟩ z The REPL for the other programming languages are accessible via the pelregal key prefix ⟨≤11⟩ z All REPL commands are accessible via the <≤12⟩ z key binding of their respective major mode. Start Shell See also: 191 - Are From Arc buffer ⟨≤11⟩ z (run-arc CMD) Run an inferior Arc process, input and output via buffer "arc", switch to that buffer. (filt) = z Fun an inferior Arc process, input and output via buffer "arc", switch to that buffer. (filt) = z Fun an inferior Arc process, input and output via buffer "arc", switch to that buffer in the process buffer on all stor commands.) From Arc buffer ⟨≤11⟩ z (filt) = z (f	
If there is a process already running in "arc", switch to that buffer. With argument, lower you to edit the command line (default is value of 'command'). Requires the arc-mode external package. Runs the hook 'inferior-arc-mode-hook' (after the 'cominit-mode-hook' is '(Type hi in the process buffer for a list of commands.) Requires the arc-mode external package. PEL activates this when the pel-use-arc user-options is set to to the sea also: 1	arc-program-
PEL activates this when the pel-use-arc user-options is set to t.	s run).
