Scrolling

Processing Pro	Description	Keystroke	Function	Note
Seroll Commands Seroll	Window Scrolling	Emacs has several scroll modes: One line scroll operations in any mode provided by the PEL package scroll commands. Single window scroll, where the navigation commands for up and down are translated to scroll operations when scroll is possible. Dual window scroll, implemented by the PEL package, where a PEL scroll command in one window is reflected in the other, associated window. The scroll-all-mode, where all windows are scrolled together when one of the native Emacs scroll commands is used.		
Secret down by near full **Note 142** One line secrol in any mode (PEL specific) Find a secret in progress and proposed any process and process and progress and process and progress and progress and process an		Emacs provides the following standard commands to scroll text in the current window. These commands scroll without having to enable a special scroll mode (just as the PEL provided single line scroll commands below). However that also work in the single window scroll and the scroll all mode. With the

This is a buffer-local minor mode for pager-like scrolling. With a prefix argument ARG, enable the mode if ARG is positive, and disable it otherwise. When enabled, keys that normally move point by line or paragraph will scroll the buffer by the respective amount of lines instead and point will be kept vertically fixed relative to window boundaries during scrolling. All Windows Scroll In this mode all visible windows are scrolled together. Toggle Scroll All Mode (scroll-all-mode & optional ARG) Toggle shared scrolling in same-frame windows (Scroll-All mode). With a prefix argument ARG, enable Scroll-All mode if ARG is positive, and disable it otherwise. When Scroll-All mode is enabled, scrolling commands invoked in one window apply to all visible windows in the same frame. Follow Mode Emacs has a scroll all windows mode which applies all scroll commands to all visible windows. To support mouse wheel or scroll bar you need to implement extra code as suggested by the Emacs Wiki Scroll All Mode page. Emacs follow-mode using 3 windows Text in the first window goes to the same buffer spread across these windows that act as a one continuous stream. Follow mode is a minor mode that combines windows into one tall virtual window. This is accomplished by two main techniques: **The windows always displays adjacent sections of the buffer. This means that wheneve one window is moved, all the others will follow. (Hence the name Follow mode). **Should point (cursor) end up outside a window, another window displaying that point is selected, if possible. This makes it possible to walk between windows using normal cursor movement commands. **Follow mode comes to its prime when used on a large screen and two or more side-by-side windows as though they were one. Toggle follow-mode **C£11> w £ (follow-mode & optional ARG)** Toggle Follow mode. With a prefix argument ARG, enable Follow mode if ARG is positive,	1 Window Scroll	The single window scroll mode allows using normal cursor movement keys to scroll the window.

Scroll two opened buffers in a split window at the same time	https://stackoverflow.com/questions/18092100/ scroll-two-opened-buffers-in-a-split-window-at-the- same-time	Use scroll-all-mode I got it to work briefly (when (SL) was displayed in the mode line lighter) but have not been able to get it to work ever since. The scroll-lock-mode behaves like it is documenting in the source code; which is just to prioritize scrolling instead of moving point in the lines.
