If the prefix argument (like C-u or M) is used, then it opens the remote GitHub hosted raw PDF instead. If the pel-flip-help-pdf-arg user-option is set it's the other way around. First time used, if no alternate input method has been selected, then prompts for another input method. For example, this can be used to select a French input method for example, one of french-prefix or french-postfix. Once an alternate input method is in effect, issuing this command again, restores the default input method. ★ Emacs default key for this is: C-\ . However, PEL rebinds it to something else. Use this when you want to change the alternate input method. For example, if you have already selected french-postfix with the above command you cannot use the toggle-input-method to change to french-prefix. So use set-input-method to force the prompt again. Prompts for the input method and then opens the help describing how the input method works. For instance if we identify the input method as french-postfix the help describes how to enter the accentuated characters with this input method. Lists all input methods that can be used. Part of those are the french-prefix and french-postfix. Display information about CODING-SYSTEM. Prompts for coding system name. Supports completion. Type RET to describe current buffer encoding. Displays information about character at point in the echo area: position, character, encoding. With any prefix argument opens a *Help* buffer and show the complete information of character at point with all properties, face, encoding, etc. Type: C-u C-x = With PEL, you can also type: C C-x = Show an interactive ASCII table in the other (next) window. |

| | C-x 8 ^ 3 | 3 | C-x 8 / e æ C-x 8 / o ø | |
| File Encoding | | ds and functions can help investi | igate and handle file encoding issues. | |
| Show encoding of file visited in current buffer | <f11> f ?</f11> | (pel-show-buffer-file- encoding) | Show coding system of file in current buffer. • Open a *Help* buffer and show the value of the buffer-file-coding-system variable. | |
| Query info about point | • C-x = | (what-cursor-position | Displays information about character at point in the echo area: position, character, | |
| | • <f11> ? d p</f11> | &optional DETAIL) | encoding. • ₩ith any prefix argument opens a *Help* buffer and show the complete information of character at point with all properties, face, encoding, etc. • Type: C-u C-x = • With PEL, you can also type: C C-x = | |
| Visit a file literally: with no encoding support and conversion | <f11> f M-1</f11> | (find-file-literally FILENAME) | Visit file FILENAME with no conversion of any kind. • Format conversion and character code conversion are both disabled, and | |
| See also: <u>> File-mngt</u> | | | multibyte characters are disabled in the resulting buffer. The major mode used is Fundamental mode regardless of the file name, and local variable specifications in the file are ignored. Automatic uncompression and adding a newline at the end of the file due to 'require-final-newline' is also disabled. If Emacs already has a buffer which is visiting the file, this command asks you whether to visit it literally instead. | |
| Change text encoding of a region or the entire file. | M-x recode- region | (recode-region START END NEW-CODING CODING) | Re-decode the region (previously decoded by CODING) by NEW-CODING. Prompts for the new and current encoding. Supports tab completion when selecting an encoding. | |
| Set coding system for coding/ decoding file names | C-x RET F | (set-file-name-coding- system CODING-SYSTEM) | Set coding system for decoding and encoding file names to CODING-SYSTEM. • It actually just set the variable 'file-name-coding-system' to CODING-SYSTEM. | |
| Select coding system for next communication with other window system clients. | C-x RET X | (set-next-selection-coding- system CODING-SYSTEM) | Use CODING-SYSTEM for next communication with other window system clients. • This setting is effective for the next communication only. | |
| Execute an I/O command with specified coding system | C-x RET C | (universal-coding-system- argument CODING-SYSTEM) | Execute an I/O command using the specified coding system. Prompts for the encoding (supports tab completion), then wait for the Emacs command to execute. | |
| Set the coding system of the file visited by current buffer - take effect on next file save. | C-x RET f | (set-buffer-file-coding- system CODING-SYSTEM &optional FORCE NOMODIFY) | Set the file coding-system of the current buffer to CODING-SYSTEM. This means that when you save the buffer, it will be converted according to CODING-SYSTEM. For a list of possible values of CODING-SYSTEM, use M-x list-coding-systems. | |
| | | | If CODING-SYSTEM leaves the text conversion unspecified, or if it leaves the end-of-line conversion unspecified, FORCE controls what to do. If FORCE is nil, get the unspecified aspect (or aspects) from the buffer's previous 'buffer-file-coding-system' value (if it is specified there). Otherwise, leave it unspecified. | |
| | | | This marks the buffer modified so that the succeeding C-x C-s surely saves the buffer with CODING-SYSTEM. From a program, if you don't want to mark the buffer modified, specify t for NOMODIFY. If you know exactly what coding system you want to use, just set the variable 'buffer-file-coding-system' directly. | |

| <u>Operation</u> | <u>Keystroke</u> | Function | <u>Note</u> |
|--|--------------------------------------|---|---|
| Set coding system for terminal keyboard | C-x RET k | (set-keyboard-coding- system CODING-SYSTEM &optional TERMINAL) | Set coding system for keyboard input on TERMINAL to CODING-SYSTEM. For a list of possible values of CODING-SYSTEM, use M-x list-coding-systems. The default is determined by the selected language environment or by the previous use of this command. If CODING-SYSTEM is nil or the coding-type of CODING-SYSTEM is 'raw-text', the decoding of keyboard input is disabled. TERMINAL may be a terminal object, a frame, or nil for the selected frame's terminal. The setting has no effect on graphical terminals. |
| Set tup multilingual environment | C-x RET 1 | (set-language-environment LANGUAGE-NAME) | Set up multilingual environment for using LANGUAGE-NAME. • This sets the coding system priority and the default input method and sometimes other things. LANGUAGE-NAME should be a string which is the name of a language environment. For example, "Latin-1" specifies the character set for the major languages of Western Europe. • If there is a prior value for 'current-language-environment', this runs the hook 'exit-language-environment-hook'. After setting up the new language environment, it runs 'set-language-environment-hook'. |
| Set coding for process associated with current buffer | C-x RET p | (set-buffer-process-coding- system DECODING ENCODING) | Set coding systems for the process associated with the current buffer. DECODING is the coding system to be used to decode input from the process, ENCODING is the coding system to be used to encode output to the process. For a list of possible coding systems, use M-x list-coding-systems. |
| Visit current buffer's file with specified coding system | C-x RET r | (revert-buffer-with-coding- system CODING-SYSTEM &optional FORCE) | Visit the current buffer's file again using coding system CODING-SYSTEM. For a list of possible values of CODING-SYSTEM, use M-x list-coding-systems. If CODING-SYSTEM leaves the text conversion unspecified, or if it leaves the end-of-line conversion unspecified, FORCE controls what to do. If FORCE is nil, get the unspecified aspect (or aspects) from the buffer's previous 'buffer-file-coding-system' value (if it is specified there). Otherwise, determine it from the file contents as usual for visiting a file. |
| Set coding system of terminal output | C-x RET t | (set-terminal-coding- system CODING-SYSTEM &optional TERMINAL) | Set coding system of terminal output to CODING-SYSTEM. All text output to TERMINAL will be encoded with the specified coding system. For a list of possible values of CODING-SYSTEM, use M-x list-coding-systems. The default is determined by the selected language environment or by the previous use of this command. TERMINAL may be a terminal object, a frame, or nil for the selected frame's terminal. The setting has no effect on graphical terminals. |
| Select coding system to communicate with other X clients | C-x RET x | (set-selection-coding- system CODING-SYSTEM) | Make CODING-SYSTEM used for communicating with other X clients. When sending or receiving text via cut_buffer, selection, and clipboard, the text is encoded or decoded by CODING-SYSTEM. |
| Display all coding categories | M-: (list- coding- categories) | (list-coding-categories) | Display a list of all coding categories. This is not an interactive function (a command). Therefore you must execute inside a Emacs Lisp program or interactively by evaluating the (list-coding-categories) form using M-: |
| Display all coding systems | | (list-coding-systems &optional ARG) | Display a list of all coding systems. This shows the mnemonic letter, name, and description of each coding system. With prefix ARG, the output format gets more cryptic, but still contains full information about each coding system. |
