Perl scripts

Writing Perl scripts		
Use the following at the beginning of Perl script files.	<pre>#!/usr/bin/perl use strict; use warnings;</pre>	 The first line of an executable script should be a valid <u>shebang line</u> identifying the appropriate location of the Perl interpreter. Most Perl code should also activate the strict Perl rules and warnings to detect warnings. See: <u>Barewords in Perl</u>
	<pre>use diagnostics;</pre>	If you want to produce more diagnostics for detected warning or errors then add the 'use diagnostics;' line.

```
Perl 5 Operators
                          Perl has a large number of operators, listed below with their precedence and associativity.
Perl 5 Operators

    C Operators missing from Perl : unary &, unary * and (type)
    Quote and Quote-like operators : in Perl quotes are operators and they provide various kind of interpolating and pattern matching capabilities
                  Note:
Associativity: one of:
    right
    left
                                     terms and list operators (leftward)
                          left
                          left
                                     Arrow Operator:
                                     Auto-increment and Auto-decrement: ++ --
Exponentiation: **
                          NA
· NA: not associative:
                          right
                                     Exponentiation:
  cannot use more than
                                     Symbolic Unary Operators:
                                                                                       -. \ and unary + and -
                          right
  one of these
                                                                              =- !-
* / % x
                          left
                                     Binding operators:
  operators in
                          left.
                                     Multiplicative Operators:
   sequence.
                          left
                                     Additive Operators:

    CH: chained

                          left
                                     Shift Operators:
                                                                              <<
                          NA
                                     named unary operators
To get this information,
                                     Class instance Operator:
                                                                              isa
                          CH
                                     Relational Operators:
                                                                              as numbers: < >
                                                                                                                      as strings: 1t
perldoc perlop
                          CH/NA
                                                                              as numbers: == !=
                                    Equality Operators:
                                                                                                      <=>
                                                                                                                      as strings: eq
                                                                                                                                          ne
                                                                                                                                                 cmp
                          left.
                                     Bitwise And:
                                                                             &
                                                                                 &.
                          left
                                     Bitwise Or and Exclusive Or:
                                                                                  |.
                          left
                                     C-style Logical And:
                          left
                                                                                        //
                                     Logical Defined-Or:
                                                                             П
                          NA
                                     Range Operators:
                          right
                                     Conditional Operator:
                                                                             ?:
                          right
                                     Assignment Operators:
                                                                                                                             >>=
                                                                             goto last next redo dump
                                     Comma, fat-comma Operators:
                          left
                                     list operators (rightward)
                          NA
                                     Logical Not:
                                                                            not
                          right
                                     Logical And:
                                                                            and
                                     Logical or and Exclusive or:
                                                                            or xor
                          left.
                                                                                                                                          (-e $fname && -f _ && -r _ ){
print("$fname exists and is readable\n");
                          It is possible to combine the file test operator with the AND operator as in the following example:
File test operators
The most important
                                     is readable
                                                                                exists.
                                                                                                                                            is a block special file.
operators are shown
                                     is writable
                                                                                                                                            is a character special file.
                                                                                is empty.
                                                                          -z
                                     is executable
                                                                                has nonzero size (returns size in bytes).
                                                                                                                                            handle is opened to a tty.
They check if the file...
                                     is owned by effective uid.
                                                                          -f
                                                                                is a plain file.
                                                                                                                                      -u
                                                                                                                                            has setuid bit set.
                          -R
                                     is readable
                                                                          -d
                                                                                is a directory.
                                                                                                                                      -g
-k
                                                                                                                                            has setgid bit set.
                          -W
                                    is writable
                                                                                is a symbolic link.
                                                                                                                                            has sticky bit set.
                                                                          -l
                                                                                is a named pipe (FIFO) or Filehandle is a pipe.
                          -X
                                     is executable
                                                                          -p
-S
                                                                                                                                     -T
                                                                                                                                            is an ASCII text file (heuristic guess).
                                                                                                                                            is a "binary" file (opposite of -T).
                          -0
                                     file is owned by real uid.
                                                                                is a socket.
```

Perl 5 Constants and Variables

					Perl 5	Constants and Variat	oles	
Perl Sigils	Sigil	Examples	Meaning				Extra Info	
Scalar	\$	\$foo \$days[28] \$days{'Feb'} \${days} \$Dog::days \$Dog'days \$#days \$days->[28] \$days[0][2] \$d{99}{'Feb'} \$d{99, 'Feb'}	Simple scalar value 29th element of array @days Value associated with the Feb key of hash %days Same as \$days, but unambiguous before alphanumerics. The \$days variable inside the Dog package. Same as above. However this is an archaic use of the single quote. Last index of array @days. 29th element of array pointed to by reference \$days. Multi-dimensional array Multi-dimensional hash Multi-dimensional hash emulation					
Array	@	@days @days[3,4,5] @days[35] @days{'J',F'}	Array slice conta Array slice conta	aining (aining (\$days[3], \$da], #days[\$#days]) . ys[4], \$days[5]) . ys[4], \$days[5]) . days{'F'}) .		
Hash/associative array	%	%days	• %days = (Ja	an =>	31, Feb => \$1	. Can be initialized as: eap? 29 : 28,) eap? 29 : 28,)		
Subroutine	&	&foo	& is needed to c	reate r	eference to subrou	itine.

Conditional statements	
Loop statements	while (condition) { }until (condition) { }

Perl 5 Functions

Perl Functions Perl syntax	 To get information about a Perl function from the command line use the perldoc -f command. To get information about print use: perldoc -f print
Cautionary notes	
 each keyword is broken Use <u>Var::Pairs</u> instead. 	Do NOT use the built-in each. It is broken, as described by <u>Damian Conway</u> in his <u>Modern Perl Best Practice O'Reilly course</u> , section control structure. • each is not re-entrant: • nested loops of each over the same hash does not work as expected and will create infinite loop since the nested loop each juts iterates from where the first loop each left it. • Exiting the loop leaves the state of the each internal pointer at the current location. • If you use each on the same hash later it will resume from where it left, it will not start form the beginning.
print functions	• <u>print</u> • <u>say</u> use feature qw(say); or use v5.10; (or higher). Like print, but implicitly appends a newline at the end of the list.
