File Management

		LIIE IVI	lanagement 	
<u>Operation</u>	Keystroke	Function	Note Emacs documentation uses the term "finding" files for that), saving files searching for files or file	
File Management See also: • <u>M Dired</u> • <u>Customize</u>	content, displaying directory content, etc These are listed in this table. • The directory editing (dired) commands are mainly listed in the MDired table. • There are also several Emacs internal and external packages that provide useful commands. PEL supports several of them, and activates them via customize user option variables. They are listed below. Use Emacs customize system to modify their values to activate, deactivate and modify the behaviour of these packages. PEL provides the <f11> <1> f key binding to quickly gain access to the appropriate customize group where you can change their values. Once you have modified the values, save them and then either execute M-x pel-init or restart Emacs.</f11>			
Open this PDF file. See also: <u>Nelp/Info</u>	<f11> f <f1> 1</f1></f11>	(pel-help-pdf &optional OPEN-WEB-PAGE)	Open the local copy of the <u>File-mngt</u> PDF file unless a command prefix (like C-u) was used. In that case it opens the Github-hosted file instead.	
PEL File/Directory Management See also: <u>Customize</u>	<f11> f <f2> 1</f2></f11>	(pel-customize-pel &optional OTHER-WINDOW)	Customize PEL support for file management. • If OTHER-WINDOW is non-nil (use C-u), display in other window.	
Customize Emacs support for file management	<f11> f <f3> 1</f3></f11>	(pel-customize-library &optional OTHER-WINDOW)	Customize Emacs support for file management.	
Customize Emacs support for file revert	<f11> f r <f3></f3></f11>	(pel-customize-library &optional OTHER-WINDOW)	Customize Emacs support for file automatic revert management.	
Customize ffap (find file at point)	<f11> f a <f3></f3></f11>	(pel-customize-library &optional OTHER-WINDOW)	Customize Emacs support for management of ffap (find file at point).	
Open application	The following comman	nds open OS level applications		
Open currently file visited in current buffer with the default OS application. See also:	<f11> f F</f11>	(pel-open-in-os-app &optional ENAME)	Open the file with the OS-registered application.	
Opening file	The following commands are available to open/visit files in Emacs buffers. For some of them the corresponding ido mode function is also shown. Note: Emacs uses the word "visiting" instead of "opening" files. The command used to 'visit' a file, find-file is Emacs default. It supports Emacs' basic tab completion. Packages that support other completion mechanisms can be installed and activated and then the command uses a different completion mechanism. PEL customization system allows you to specify whether you want to use one or several other completion mechanisms. It also has a command to change the completion mechanism dynamically. You can change it without restarting Emacs or event re-executing pel-init. See the Completion/Input and Customize tables for more info.			
File Lock Protection	locked file , Emacs will steal the lock (Emacs protects against multiple processes modifying the same file with a lock. If you attempt to edit the buffer of a locked file, or save a buffer of a locked file, Emacs will prompt. You can then: • steal the lock (with 's'), • proceed ('p') to edit the file anyway or • quit ('g').		
Open file using OS file- open dialog	%-0	(ns-open-file-using-panel)	6 On macOS in graphics mode only: open a file, select the file name via an OS File dialog.	
Open (visit) a file/directory See also:	C-x C-f	(find-file FILENAME &optional WILDCARDS) (ido-find-file)	Prompt for the file or directory name to open. Open the selected file/directory in a buffer with the appropriate mode. For directory, the buffer opens in Dired-mode.	
- ∑Completion/Input - ∑M Dired - ∑ Customize	 This can be replaced by the ido-mode by the ido-find-file: it provides suggestions. When ido mode is used, you can also: Type C-f or C-x f to change to original find-file mode and prevent Ido completion from trying to provide the name of an existing file when you want to specify the name of a file that does not exists yet. Type C-j to accept the file/directory name verbatim without replacement or suggestion. This is often useful to open a directory in directory editing (dired) mode. To open a file in read-only mode you can: Use one of the commands below (C-x C-x, etc) Use C-x C-f then type C-x C-q to change the mode of the buffer to read-only mode. PEL supports dynamic selection of completion input that control the way this command operates to help you select a file name: (ido, ivy, helm). 			
Open another file in buffer	C-x C-v	(find-alternate-file FILENAME & optional WILDCARDS) (ido-find-alternate-file)	Kills buffer and open the newly specified file in a new buffer same window. When ido-mode is used, the ido-find-alternate-file is used instead. Useful when just selected an empty file just selected by mistake.	
Open file in other window	• C-x 4 f • <f11> f o</f11>	(find-file-other-window FILENAME & optional WILDCARDS) (ido-find-file-other- window)	Edit file FILENAME, in another window. Like C-x C-f, but creates a new window or reuses an existing one.	
Open file in other frame	C-x 5 f	(find-file-other-frame FILENAME & optional WILDCARDS) (ido-find-file-other-frame)	Edit file FILENAME, in another frame. Like C-x C-f, but creates a new frame or reuses an existing one.	
Open in read-only	The following comman	nds open files in read-only mode.	While in read-only mode, use Use C-x C-q to permit editing.	
Open a file in read-only mode	C-x C-r	(find-file-read-only FILENAME & optional WILDCARDS) (ido-find-file-read-only)	Edit file FILENAME but don't allow changes. Like C-x C-f, but marks buffer as read-only. Use C-x C-q to permit editing.	
Open file in other window in read-only mode	• C-x 4 r • <f11> f 0</f11>	(find-file-read-only-other-window FILENAME & optional WILDCARDS) (ido-find-file-read-only-other-window)	(find-file-read-only-other-window FILENAME &optional WILDCARDS) Edit file FILENAME in another window but don't allow changes. Like C-x C-f, but marks buffer as read-only. Use C-x C-q to permit editing.	
Open Literally	Open a file with no end	coding conversion		
Visit a file literally: with no encoding support and conversion	<f11> f M-1</f11>	(find-file-literally FILENAME)	Visit file FILENAME with no conversion of any kind. Format conversion and character code conversion are both disabled, and multibyte characters are disabled in the resulting buffer. The major mode used is Fundamental mode regardless of the file name, and local variable specifications in the file are ignored. Automatic uncompression and adding a newline at the end of the file due to 'require-final-newline' is also disabled. If Emacs already has a buffer which is visiting the file, this command asks you whether to visit it literally instead.	
Open binary	Open a file in hex bina	ry mode. There are also comman	ds to convert current buffer to hexadecimal editing, like nhexl. See <u>N Buffers</u> .	
Open a file in hexl-mode See also: <u>∑ Buffers</u>	<f11> f M-x</f11>	(hexl-find-file FILENAME)	Edit file FILENAME as a binary file in hex dump format, using the 'hexl-mode'. • Switch to a buffer visiting file FILENAME, creating one if none exists.	

<u>Operation</u>	<u>Keystroke</u>	Function	<u>Note</u>	
Recently opened	The menu bar include	recentf user option is set to t, Emdes a File->Open Recent menu en are activated by their respective		
Open recently opened files, listed with Ido	<f11> f f</f11>	(ido-recentf-open)	Open file. Prompt suggests recently opened files wit Ido-style completion. • Type <tab> to get possible expansions listed in a separate buffer. Available only when both pel-use-ido and pel-use-recentf are set to t. Credits: Mickey Petersen recentf article.</tab>	
Open recently opened files, listed with Counsel	<f11> f R</f11>	(counsel-recentf)	List files recently opened in a counsel buffer. • The list of recently opened files are listed in a Counsel buffer. Select one and type return to open. • Type C-c C-o to copy the list of files inside a special buffer. • Requires <a '' ()[]{}<="" href="https://www.numerice.com/www.numerice.com/www.numerice.com/www.numerice.com/www.numerice.com/www.numerice.com/ww.numerice.com</td></tr><tr><td>Edit list of recently opened</td><td><f11> f M-r</td><td>(recentf-edit-list)</td><td>Counsel and pel-use-recentf to t Show a dialog to delete selected files from the recent list. Open filename at point in a browser See also: • <u>See Key-Chords</u> • <u>Sweb</u>	• <f11> f / • 6u</f11>	(pel-browse-filename-at- point)	Open the file name at point inside the system's browser. If point is at a directory name, open the systems application that browses directories (eg. macOS Finder, Windows Explorer). This is the same as using pel-open-at-point with the argument N set to 9. It is easier to type and PEL assigns its own key-chord for it.	
Open URL at point in a browser See also: • Key-Chords • Web • Customize	• <f11> f M-/ • 7u</f11>	(browse-url-at-point &optional ARG)	Ask a WWW browser to load the URL at or before point. Variable 'browse-url-browser-function' says which browser to use. Optional prefix argument ARG non-nil inverts the value of the option 'browse-url-new-window-flag'. PEL provides the <f11> <f2> E u key sequence to open the browse-url group that contains relevant the user options.</f2></f11>	
ffap commands	Emacs provides the ffap (find file at point) command set. The ffap command is similar to pel-find-file-at-point-in-window but does not support line and numbers, does not support identifying a window with command arguments and is not designed to support multiple programming languages. It does however support other facilities and can be installed to replace the behaviour of standard file management command bindings such as C-x C-f. PEL activates the Emacs built-in ffap library when the pel-use-ffap user option is set to either t or to ffap-bindings. In both cases these activate the key bindings shown below. When pel-use-ffap is set to ffap-bindings, then PEL also activates the standard ffap bindings which take over the behaviour of the main file finding and dired commands. This means that Ido, Ivy or Helm are no longer available for these commands. If pel-use-ffap is only set to t then the standard ffap bindings is not activated.			
Find file/URL at point	<f11> f a p</f11>	(ffap &optional FILENAME)	Find FILENAME, guessing a default from text around point. If 'ffap-url-regexp' is not nil, the FILENAME may also be an URL. Web URL opens in browser. With a prefix, this command behaves exactly like 'ffap-file-finder'. If 'ffap-require-prefix' is set, the prefix meaning is reversed. See also the variables 'ffap-dired-wildcards', 'ffap-newfile-prompt', 'ffap-url-unwrap-local', 'ffap-url-unwrap-remote', and the functions ffap-file-at-point' and 'ffap-url-at-point'.	
Find file/URL at point - read only	<f11> f a P</f11>	(ffap-read-only)	Like 'ffap', but mark buffer as read-only.	
Find another file/URL at point in window	<f11> f a v</f11>	(ffap-alternate-file)	Like 'ffap' and 'find-alternate-file': kills current buffer and open new file in the same window.	
Find file/URL in other window	<f11> f a w</f11>	(ffap-other-window)	Like 'ffap', but put buffer in another window.	
Find file/URL in other frame	<f11> f a f</f11>	(ffap-other-frame)	Like 'ffap', but put buffer in another frame.	
Find file/URL in other window - read only	<f11> f a W</f11>	(ffap-read-only-other- window)	Like 'ffap', but put buffer in another window and mark as read-only.	
Find file/URL in other frame - read only	<f11> f a F</f11>	(ffap-read-only-other-frame)	Like 'ffap', but put buffer in another frame and mark as read-only.	
Start Dired with file at point	<f11> f a d</f11>	(dired-at-point &optional FILENAME)	Start Dired, defaulting to file at point. See 'ffap'.	
Start Dired with file at point in other window	<f11> f a D</f11>	(ffap-dired-other-window)	Like 'dired-at-point', but put buffer in another window.	
Start Dired with file at	<f11> f a M-d</f11>	(ffap-dired-other-frame)	Like 'dired-at-point', but put buffer in another frame.	
point in other frame				

<u>Operation</u>	<u>Keystroke</u>	Function	<u>Note</u>	
List directory of file at point	<f11> f a l</f11>	(ffap-list-directory)	Like 'dired-at-point' and 'list-directory'.	
Open a menu of all files, URL in current buffer.	<f11> f a m</f11>	(ffap-menu &optional RESCAN)	Put up a menu of files and URLs mentioned in this buffer. Then set mark, jump to choice, and try to fetch it. The menu is cached in 'ffap-menu-alist', and rebuilt by 'ffap-menu-rescan'. The optional RESCAN argument (a prefix, interactively) forces a rebuild. Searches with 'ffap-menu-regexp'.	
Open <u>Dired</u> (Directory Editor)	When "opening" (visiting) a directory Emacs opens a buffer in Dired mode, that looks like a Is -I output, which allows several operations. If you specify a directory path to Cx C-f then Dired-mode is used. You can also use the following commands to open buffer in Dired mode. It's also possible to browse a file directory tree with file tree browsers, like NeoTree and Ztree, described below in this table. The Speedbar can also be used.			
Open a directory editor See also: <u>∑M Dired</u>	• C-x d • #-D	(dired DIRNAME &optional SWITCHES) (ido-dired)	Opens a Dired-mode buffer on the specified directory. Prompt for the directory name. PEL activates ido when the pel-use-ido-mode user option is set to t.	
Run Dired in other (next) window	C-x 4 d	(dired-other-window)	Opens a Dired-mode buffer on the specified directory inside another window. Prompt for the directory name.	
List Directory	C-x C-d	(list-directory DIRNAME &optional VERBOSE)	Display a list of files in or matching DIRNAME, a la 'ls'. DIRNAME is globbed by the shell if necessary. Prefix arg (C-u) means supply -l switch to 'ls'.	
Activating URLs to browse and open files	Emacs provides the goto-url-mode and the goto-url-prog-mode that turn URLs found in the current buffer into clickable buttons. • Once the mode is active use C-c RET or the mouse to click on the button. • If the URL is an email address a buffer to write an email to that address opens. • If the URL is a web or FTP address the system browser is invoked to open the address. © Customization group: goto-address			
Toggle goto-addr-mode	<f11> f u</f11>	(goto-address-mode &optional ARG)	Minor mode to buttonize URLs and e-mail addresses in the current buffer. With a prefix argument ARG, enable the mode if ARG is positive, and disable it otherwise.	
Toggle goto-addr-prog- mode	<f11> f U</f11>	(goto-address-prog-mode &optional ARG)	Like 'goto-address-mode', but only for comments and strings.	
Open the URL (email or web page)	C-c RET	(goto-address-at-point &optional EVENT)	Open the URL at point: If URL is a web page: open it in a browser If URL is a mail address: Send mail to address at point: Find e-mail address around or before point. Then search backwards to beginning of line for the start of an e-mail address. If no email address is found there, then load the URL at or before point.	
Insert text of another file at point	The following comman	nds can be used to insert text from	n other files at point in the current buffer.	
Insert file at point	• C-x i • <f11> f i</f11>	(insert-file FILENAME) (ido-insert-file)	Insert contents of file FILENAME into buffer after point. • Set mark after the inserted text.	
Insert file literally at point	<f11> f I</f11>	(insert-file-literally FILENAME)	Insert contents of file FILENAME into buffer after point with no conversion. • Set mark after the inserted text.	
Write text into specified file	The following commands can be used to write text selected from current buffer into specified file.			
Write region text to file	<f11> f w</f11>	(write-region START END FILENAME &optional APPEND VISIT LOCKNAME MUSTBENEW)	Write current region into specified file. • Prompts for the specified file.	
Append region text to file	<f11> f W</f11>	(append-to-file START END FILENAME)	Append the contents of the region to the end of file FILENAME. • Prompts for the specified file.	
Set file mode	<f11> f m</f11>	(set-file-modes FILENAME MODE)	Set mode bits of file named FILENAME to MODE (an integer). Only the 12 low bits of MODE are used. Prompts for file name and then for chmod-like file mode value.	
Reverting Files	If the file's content changed on the disk and you want to refresh the Emacs buffer visiting that file, you need to "revert" the file. If you want to use Emacs to monitor the content of a file that is continuously modified by an external process (like a log file) set the <i>revert-without-query</i> variable to a list of regular expressions describing the field it'll apply to. You can also activate the auto-revert mode for the current buffer or globally and restart its timer.			
Revert a buffer See also: <u>∑ Diff & Merge</u>	• <f11> f r f • %-u</f11>	(revert-buffer &optional IGNORE-AUTO NOCONFIRM PRESERVE-MODES)	Replace current buffer text with the text of the visited file on disk. • This undoes all changes since the file was visited or saved. • With a prefix argument, offer to revert from latest auto-save file, if that is more recent than the visited file. • This is also the command to use to reload a file that was modified on the file system. • You can use ediff-current-file to see the difference between the buffer and its disk file. PEL binding for this is <f11> e b f.</f11>	
Toggle auto-revert mode	<f11> f r a</f11>	(auto-revert-mode &optional ARG)	Toggle reverting buffer when the file changes (Auto-Revert Mode). With a prefix argument ARG, enable Auto-Revert Mode if ARG is positive, and disable it otherwise. • Auto-Revert Mode is a minor mode that affects only the current buffer. When enabled, it reverts the buffer when the file on disk changes. • When a buffer is reverted, a message is generated. This can be suppressed by setting 'auto-revert-verbose' to nil.	
Toggle auto-revert tail mode	<f11> f r t</f11>	(auto-revert-tail-mode &optional ARG)	 Toggle reverting tail of buffer when the file grows. With a prefix argument ARG, enable Auto-Revert Tail Mode if ARG is positive, and disable it otherwise. When Auto-Revert Tail Mode is enabled, the tail of the file is constantly followed, as with the shell command 'tail -f'. This means that whenever the file grows on disk (presumably because some background process is appending to it from time to time), this is reflected in the current buffer. You can edit the buffer and turn this mode off and on again as you please. But make sure the background process has stopped writing before you save the file! 	
Cancel/restart auto-revert timer	<f11> f r SPC</f11>	(pel-auto-revert-set-timer)	 Restart or cancel the timer used by Auto-Revert Mode. If such a timer is active, cancel it. Start a new timer if Global Auto-Revert Mode is active or if Auto-Revert Mode is active in some buffer. Restarting the timer ensures that Auto-Revert Mode will use an up-to-date value of 'auto-revert-interval' (which is normally 5 seconds by default). : pel-auto-revert-set-timer is a thin wrapper over auto-revert-set-timer that displays a warning if executed when the buffer is not already in auto-revert-mode. It also displays the value of auto-revert-interval when auto-revert-set-timer is executed. 	

<u>Operation</u>	<u>Keystroke</u>	Function	<u>Note</u>
Saving Files	Use the following com	mands to save the content of a bu	uffer to a filesystem file.
	PEL supports the following controllable actions on file save. Each of these actions are activated via an action-specific PEL user-option, and can temporarily be disabled with a command for the file in the current buffer. The actions and their associated user-option and command are listed here:		
	Action Delete trailing space Update time stamp Update copyright no	e and lines on save pel-delete- on save pel-update	Luser-optionOverriding commandKey Sequence-trailing-whitespacepel-toggle-delete-trailing-space-on-save <f11> M-W-time-stamppel-toggle-update-time-stamp-on-save<f11> M-T-copyrightpel-toggle-update-copyright-on-save<f11> M-C</f11></f11></f11>
Save file to disk	• C-x C-s • %-s	(save-buffer &optional ARG)	Save current buffer to associated file. By default, it makes the previous version into a backup file if previously requested or if this is the first save. • With C-u: marks this version to become a backup when the next save is done • With C-u C-u: makes the previous version into a backup file • With C-u C-u: marks this version to become a backup when the next save is done, and makes the previous version into a backup file. • With prefix 0: never make the previous version into a backup file. • On macOS in graphics mode only: %-s brings a OS file-save dialog. A Save and activated on-file-save actions only occur when the buffer is in "changed" status. Use M to flip that status to force an action when it has just been activated.
Save all/some files	C-x s	(save-some-buffers &optional ARG PRED)	Prompt for files that are modified. Options: • y : save • n : don't save • C-r : look at the buffer in question • d : view differences with diff-buffer-with-file
Write buffer to specified file	C-x C-w	(write-file FILENAME &optional CONFIRM) (ido-write-file)	Similar to "Save-As": prompt for the filename. • Can also be yanked in the mini buffer, use M-n to edit it. • Use that command to rename the file.
Changed current buffer changed state	M-~	(not-modified &optional ARG)	Mark current buffer as unmodified, not needing to be saved. • With C-u prefix ARG, mark buffer as modified, so C-x C-s will save.
Toggle copyright update on save	<f11> M-C</f11>	(pel-toggle-update- copyright-on-save &optional GLOBALLY)	Toggle copyright update on file save and display current state. • By default change behaviour for local buffer only. • When GLOBALLY argument is non-nil, using any prefix argument, change it for all buffers for the current Emacs editing session (the change does not persist across Emacs sessions). • To modify the global state permanently modify the customized value of the 'pel-update-copyright' user option via the 'pel-pkg-for-filemng' group customize buffer with <f11> f <f2> 1. ✓ This command is only available when the pel-update-copyright is set to t.</f2></f11>
Toggle timestamp update on save	<f11> M-T</f11>	(pel-toggle-update-time- stamp-on-save &optional GLOBALLY)	Toggle time-stamp update on file save and display current state. • By default change behaviour for local buffer only. • When GLOBALLY argument is non-nil, using any prefix argument, change it for all buffers for the current Emacs editing session (the change does not persist across Emacs sessions). • To modify the global state permanently modify the customized value of the 'pel-update-time-stamp' user option via the 'pel-pkg-for-filemng' group customize buffer with <f11> f <f2> 1. It is command is only available when the pel-update-time-stamp is set to t.</f2></f11>
Toggle delete trailing space on save	<f11> M-W</f11>	(pel-toggle-update-time- stamp-on-save &optional GLOBALLY)	 Toggle deletion of trailing spaces on file save and display current state. By default change behaviour for local buffer only. When GLOBALLY argument is non-nil, using any prefix argument, change it for all buffers for the current Emacs editing session (the change does not persist across Emacs sessions). To modify the global state permanently modify the customized value of the 'pel-delete-trailing-whitespace' user option via the 'pel-pkg-for-filemng' group customize buffer with <f11> f<f2> 1.</f2></f11> This command is only available when the pel-delete-trailing-whitespace user-option s set to t.
Automatic File Time Stamp on file save	Emacs has a built-in automatic time-stamping of files. It must be activated by adding the time-stamp function to the before-save-hook variable. This can either be done via Emacs customization system or explicitly inside your init file with the following code: (add-hook 'before-save-hook 'time-stamp) The time stamp will be added to files that contain, inside their first 8 lines, a line that looks like one of the following: Time-stamp: Time-stamp: " The format of the time stamp is controlled by several variables: time-stamp-format specifies the format of the time stamp. Something like "%:y-%02m-%02d %02H:%02M:%02S %u" to specify the date and time in ISO format, with the user login's name. time-stamp-time-zone specifies the time zone selection: nil: Emacs local time t: Universal time wall: system wall clock time To insert a non-updatable time stamp, the PEL package provides a set of text insert commands which include inserting a time stamp. See the Inserting Text table for the appropriate commands.		
Update file time stamp	<f11> f t</f11>	(time-stamp)	Force update the time stamp string(s) in the current buffer. The time stamp is updated if the one of the following strings is found in the first 8 lines of the file:
See also: <u>∑ Inserting Text</u>			Time-stamp: <> Time-stamp: <> Time-stamp: " If you want time stamps updated automatically, write the following inside your init.el file: (add-hook 'before-save-hook 'time-stamp)
Toggle time stamp automatic update		(time-stamp-toggle-active &optional ARG)	Toggle 'time-stamp-active', setting whether <f11> f t updates a buffer. • With ARG, turn time stamping on if and only if arg is positive.</f11>
Inserting & Automatically Updating Copyrights	Emacs has built-in support for insertion and update of copyright notices inside files. Two commands, shown below, are provided to manually insert or update the file's copyright notice. The copyright notice can be automatically updated by adding the copyright-update function to the list of before-save-hook variable with the following		
Insert copyright notice at point See also: ∑ Inserting Text	<f11> i C</f11>	(copyright &optional STR ARG)	Insert a copyright by \$ORGANIZATION notice at cursor. • If the ORGANIZATION environment variable is not available, Emacs prompts for it.
	-	!	

	<u>Keystroke</u>	Function	<u>Note</u>
Update file's copyright notice		(copyright-update &optional ARG INTERACTIVEP)	Update copyright notice to indicate the current year. • With prefix ARG, replace the years in the notice rather than adding the current year after them. If necessary, and 'copyright-current-gpl-version' is set, any copying permissions following the copyright are updated as well. • If non-nil, INTERACTIVEP tells the function to behave as when it's called interactively. ⚠ Even when used interactively copyright-update does not warn if there is no copyright in the current buffer to update. It does not create a missing notice. If you want to be prompted automatically to update an existing but out-of-date copyright notice, write the following inside your init.el file: (add-hook 'before-save-hook 'copyright-update)
Directory Tree Browsers	 Emacs built-in <u>∑M</u> The Emacs built-in 		several extensions. You can have several different Dired buffers in an Emacs session. There can only be one instance of a Speedbar buffer and that can be inside another frame.
View Directory Tree with NeoTree	The NeoTree external package provides a Vim-NerdTree like tree-view of a directory with expansion/collapse. PEL activates it when pel-use-neotree is set to t. <f11> B N <f2> opens the PEL customization group to set pel-use-neotree. <f11> B N <f3> prompts, select neotree to open the neotree customization group. There is only one NeoTree window. It is a dedicated window. lons used in the tree can be changed: In text mode set pel-neotree-font-in-terminal to arrows to use arrows instead of '+'. In graphics mode, if pel-neotree-font-in-graphics is set to icons then the icons provided by all-the-icons package is used. However, once PEL has installed the package it does not install the fonts. You must install the fonts manually by executing: M-x all-the-icons-install-fonts</f3></f11></f2></f11>		
View directory tree with	<f11> B N N</f11>	(neotree-toggle)	Toggle show/hide the NeoTree window.
NeoTree		 U Go up a directory g Refresh A Maximize/Minimize the Neo H Toggle display hidden files. O Recursively open a director 	Tree Window Controlled by neo-hidden-regexp-list user option. y ate a directory if filename ends with a '/' rectory. directory. directory. directory. rectory.
Open NeoTree for dir of current buffer	<f11> B N F</f11>	(neotree-find &optional PATH DEFAULT-PATH)	Open a NeoTree window using the directory of the current buffer. No prompt.
Open NeoTree for specified directory	<f11> B N D</f11>	(neotree-dir PATH)	Prompt for a directory. Open a Neotree window for that directory.
Close NeoTree window	<f11> B N H</f11>	(neotree-hide)	Close the NeoTree window.
Show NeoTree window	<f11> B N S</f11>	(neotree-show)	Show the NeoTree window.
