Customizing Emacs with PEL

Operation	Keystroke	Stomizing Emacs	Note	
PEL: Control Emacs			ad of having to write Emacs Lisp code, you use Emacs easy-to-use	
via Easy Customization	customization system. This table shows how to quick buffers that operate in the Cus The first section shows navi	ata using commands that open buffers that show the customized data inside ings to speed up operation in that mode. a buffer that shows customized data (also called user options). buffers in Customization Mode to manage user options of interest.		
	PEL - Configuration through Customization PEL provides a growing set of customization groups and user option variables that control several aspects of Emacs: The "pel-use-" activation user options identify what built-in or external Emacs Lisp package to use. PEL has logic to autoload the packages only when you need them. This way your Emacs will start quickly even if you have identified a large number of packages. Once a package or feature is activated with the "pel-use-" user option, the other options control different behaviour of the activated package. Once you have modified the configuration, execute M-x pel-init. PEL will activate the new configuration.			
Open this PDF file. See also: <u>▼ Help/Info</u>	<f11> <f2> <f1></f1></f2></f11>	(pel-help-pdf &optional OPEN-WEB-PAGE)	Open the <u>Note Customize</u> PDF using method specified by the pel-open-pdf-method user-option or the alternate one if a command prefix (like C-u) was	
Customization Data	By default Emacs stores the customization data inside the Emacs init.el file, along with your other configuration, as Lisp codes set-variable form.			
	When using PEL, and perhal control independently from y		we Emacs store this data inside a separate file that you can put under VCS ng it inside the file ~/.emacs.d/emacs-customization.el . file to do so:	
	(setq custom-file "~/ (load custom-file)	/.emacs.d/emacs-customization.e	1")	
	 When using PEL, that code must be located before the call to pel-init. The use of a file to store Emacs customization data separate from the Emacs init.el file provides another degree of freedom and flexibile becomes possible to easily distribute a configuration to several computers (or even users) without sharing more private information the kept inside the init.el file. 			
Customize Mode	This section describes comma commands described in the se		Customize-mode showing the various user options you got access to using the	
Move to Avy/Ace target	0	(ace-link-custom)	 Highlight each target with an Avy/Ace single or double letter target. Type the letter(s) to move to that position. This is a very efficient and quick navigation mechanism. 	
See also: <u>Navigation</u>			• This is a very emicient and quick navigation mechanism. • PEL downloads, installs and activates it when the pel-use-ace-link user option is set to t.	
Apply customization changes	C-c C-c	(Custom-set &rest IGNORE)	Set the current value of all edited settings in the buffer.	
Apply and Save customization changes	C-x C-s	(Custom-save &rest IGNORE)	Set all edited settings, then save all settings that have been set. • If a setting was edited and set before, this saves it. If a setting was merely edited before, this sets it then saves it.	
Quit Customization and close buffer	ď	(Custom-buffer-done &rest IGNORE)	Exit current Custom buffer according to 'custom-buffer-done-kill'.	
Browse customize data tree	The following commands create a tree browser for the customize hierarchy inside a *Customize Browser* buffer. Each node can we expanded down to a single options and any can be collapsed. Note that PEL's customization groups and options are all always available contrary to the ones that will be available in the Emacs group because the Emacs group contains only what is currently loaded and the PEL one is always loaded.			
Browse complete customize data tree from root: Emacs	<f11> <f2> B</f2></f11>	(customize-browse &optional GROUP)	Open the customize tree bowser for the entire Emacs customization data already loaded. • Unfortunately this command does not prompt it always opens the tree from the root. To specify a group use the command shown below. • Emacs is only able to show information it knows about. Customization data defined in files not loaded will not be accessible.	
Browse customize data tree from specified group	<f11> <f2> b</f2></f11>	(pel-browse-group GROUP)	Browse the customization tree from a specific group node. • Prompts for a group name. Supports tab completion. • All PEL groups have a name that starts with "pel-". • Emacs is only able to show information it knows about. Customization data defined in files not loaded will not be accessible. All of PEL data is always loaded. • She pel-customize-library commands available as the <f3> key of PEL key prefixes does not suffer from this problem: it will detect that the library is not loaded and will prompt you for loading it, giving you access to the customization buffer when you need it. The information is available in the various PDF pages at the top of each page.</f3>	
Browse PEL customize data tree	<f11> <f2> P B</f2></f11>	(pel-customize-browse)	Open the customize tree bowser for the entire PEL customization data (which is under Emacs/Convenience.	
Emacs Easy Customization	With the following command you can gain access to the Customize-mode to customize anything of interest. With the first command you open the customization buffer and then you can search or browse what you want to customize. The second command allow you to open the buffer at a specific customization group and the third one at a specific user option. These commands prompt for the information you are looking for. You can always use completion by typing <tab> at any point to get a list of available groups or variables. Several of the commands below open the PEL customization group and one or several other groups related to the same topic, when these groups are already loaded. • If you set the OTHER-WINDOW argument, the command open s the buffer in another window and also open any group related that exists. For example if you open the PEL group for grep with C-u <f11> <f2> g, this will also open the grep group, the rg and ripgrep groups if they are loaded. Each group will open inside its own bugger and the command will create the necessary windows. • Until a package is loaded its customization group is unknown to Emacs and no buffer will be opened for it. To see the customization group, if they are loaded the package via one of its command that is auto-loaded or load it explicitly.</f2></f11></tab>			
	 Solution Note however that the PEL commands that open customization groups attempt to identify the library where the customization group is defined and will prompt you to load the related library to enable access to the customization group. The groups accessible via the PEL commands are limited to what PEL supports. 			
Customize Emacs	<f11> <f2> c</f2></f11>	(customize)	Select a customization buffer which you can use to set user options. • User options are structured into "groups". • Initially the top-level group 'Emacs' and its immediate subgroups are shown; the contents of those subgroups are initially hidden. • Emacs is only able to show information it knows about. Customization data defined in files not loaded will not be accessible.	

<u>Operation</u>	<u>Keystroke</u>	Function	<u>Note</u>
Customize a specific group	<f11> <f2> g</f2></f11>	(customize-group &optional GROUP OTHER-WINDOW)	Customize GROUP, which must be a customization group. If OTHER-WINDOW is non-nil (use C-u), display in another window. This command provides completion and you can use it to detect groups. Emacs is only able to show the name names of groups that are defined in files that have already been loaded. You won't be able to open a group that is not already loaded. The pel-customize-library commands available as the <f3> key of PEL key prefixes does not suffer from this problem: it will detect that the library is not loaded and will prompt you for loading it, giving you access to the customization buffer when you need it. The information is available in the various PDF pages at the top of each page.</f3>
Customize a user option	<f11> <f2> o</f2></f11>	(customize-option SYMBOL)	Customize SYMBOL, which must be a user option. • As with groups, Emacs provides completion for user options, allowing you to detect user options. • Emacs is only able to show the name names of user options that are defined in files that have already been loaded. You won't be able to open a group that is not already loaded. But see the notice in the above cell.
Activate and cleanup your packages using PEL customization user- variables	PEL provides customization-driven package management. PEL controls download, installation and configuration of the packages supported by its pel-use- user-options controlled by the PEL customization groups. The packages missing are installed when you start Emacs or when you explicitly run the pel-init command. PEL also removes the packages that are not required by the PEL user-options when you issue the pel-cleanup command. Use a key prefix for this command to perform a dry-run of the command and produce a report of what would be removed. PEL does not delete packages. Instead it places them into separate directories, called "attic" directories. You can then retrieve the package from the directories later. The elpa packages are stored in the directory identified by package-user-dir or in the "elpa" directory inside the user-emacs-directory. The elpa attic is identified by a name that appends "-attic" to the above directory name. On a Unix-like system that would normally be "-/.emacs.d/elpa" and "-/.emacs.d/elpa-attic". The non-elpa files are stored in the directory identified by the pel-utils-dirname user-options (which defaults to "utils") inside the directory identified by the user-emacs-directory. Its attic directory name is the same name with a "-attic" suffix. By default, on Unix-like systems the directories are "-/.emacs.d/utils" and "-/.emacs.d/utils-attic". On Windows system the directories are located in your User directory, as controlled by Emacs. Also on Emacs 27.1 and later these directories can be located somewhere else.		
Re-initialize PEL, activate the new PEL user-option, install packages newly requested	M-x pel-init	(pel-init &optional CACHED-ABBREV-FILE-NAME)	Re-initialize PEL. Download, install and configure any package requested by the various pel-use- user-options that have not yet been installed. Does not remove anything. Use pel-cleanup for that. The argument is not accessible interactively and exists for the initial Emacs startup only.
Show PEL user option and package info See also: Help/Info	<f11> ? e ?</f11>	(pel-package-info &optional FULL-REPORT)	Display the following information in the echo area: • The number of PEL user-options, and the number of them that are active. • The number of Elpa packages active: the count of the ones directly installed because of active PEL user-options and the count of them installed as dependencies of the first group. • The number of Emacs Lisp files stored in the ~/.emacs.d/utils (or equivalent directory) as a result of PEL user options. • With optional argument, generates a full report with much more details in a *pel-user-options* report buffer. Any key prefix works. M <f11>? e for example.</f11>
Disable all packages not requested by PEL user-options and not identified as dependency or packages that must be kept. Update the load path and the customization file content.	M-x pel-cleanup	(pel-cleanup &optional DRY-RUN)	After prompting for a confirmation, de-activates all Elpa and non-Elpa packages that are not requested by a PEL user-option. The command keeps packages that are dependencies of packages required by PEL user-options and packages that PEL always requires. It also keeps packages that you have identified as manually installed in the following user options: • pel-elpa-packages-to-keep • pel-utils-packages-to-keep • Pel-utils-packages-to-keep Arrow To the current version of PEL when you install an Emacs package with the Emacs package system, PEL does not automatically add the package name in the pel-elpa-packages-to-keep user-option. If you want to keep that package and configure it yourself with your own Emacs Lisp code invoked by your init.el file, add the package symbol name to the list of pel-elpa-packages-to-keep otherwise pel-cleanup will move the package to the elpa-attic.
Perform a dry-run of pel- cleanup. Generate a detailed report.	M M-x pel-cleanup		Runs pel-cleanup in dry-mode and produce a detailed report of what pel-pel-cleanup would remove in a *pel-cleanup* buffer.
Input Completion Mode Selection See also: •	PEL supports several input completion modes: 1. Emacs' default tab completion 2. Helm mode completion 3. Ido mode completion 4. Wy mode completion 5. Is set pel-use-ido to t 6. Ido/Helm mode where Ido is used for dealing with Files and buffers and Helm is used everywhere else (including all Helm specific commands). • PEL also has commands that uses the ilMenu system to list symbol defined in the current or all buffers. The behaviour and user interface or these commands can be modified and extended by several external package and customization user-options: • pel-imenu-follows-order-p user-option controls whether entries are sorted or follows the order of declaration in the file. • Itimenu external package and customization user-option is used by pel-goto-symbol-any-buffer to jump to symbol definition of any buffer using one of the following input completion method. The user-option must be set to one of the following values: • Use emacs-default: basic Emacs completion. Use tab to see possible matches. • Use ldo. Pel-use-ido must be turned on. • Use lky. Requires lymode pel-use-helm must be turned on. • Use lky. Requires lymode pel-use-helm must be turned on. • Use helm. Requires Helm mode pel-use-helm must be turned on. • Use helm. Requires Helm mode activated by pel-use-popup-switcher user-option, provides one pop-up menu for the iMenu content. • popup-imenu external package activated by pel-use-popup-switcher user-option, provides the same as popup-imenu and more. **To customize the above, use: • <fi><fi><fi><fi><fi><fi><fi><fi><fi><fi></fi></fi></fi></fi></fi></fi></fi></fi></fi></fi>
