Perl scripts

Writing Perl scripts		
Use the following at the beginning of Perl script files.	<pre>#!/usr/bin/perl use strict; use warnings;</pre>	 The first line of an executable script should be a valid <u>shebang line</u> identifying the appropriate location of the Perl interpreter. Most Perl code should also activate the strict Perl rules and warnings to detect warnings. See: <u>Barewords in Perl</u>
	use diagnostics;	• If you want to produce more diagnostics for detected warning or errors then add the 'use diagnostics;' line.

	use di	<u>lagnostics;</u>	 If you want to pr 	oduce mo	re diagnost	ics for dete	ected wa	arning or erro	rs then a	ıdd the 'use	diagnostic	s;' line.

regexp debug flag	\${^RE_DEBUG_FLAG}						
regexp internal optimization/memory	\${^RE_TRIE_MAXBUF}						
Variables related to file handles	See also: Perl File Handles						
Name of current file read from <>	\$ARGV	Command line arguments of the script	@ARGV	Number of arguments minus one	\$#ARGV		
Special file handle that iterates over command-line filenames in @ARGV	ARGV	Special file handle that points to currently open output file when doing edit-in-place processing	ARGVOUT				
Output field separator for the print operator	 IO::Handle->output_field_separator(EX \$OUTPUT_FIELD_SEPARATOR \$OFS \$, 	KPR)	Current line number for the last file handled accessed	• HANDLE->input_ • \$INPUT_LINE_N • \$NR • \$.	line_number(EXPR) UMBER		
Input record separator (newline by default)	IO::Handle->input_record_separator(E. \$INPUT_RECORD_SEPARATOR \$RS \$/	Output record separator	 IO::Handle->output_record_separator(EXPR) \$OUTPUT_RECORD_SEPARATOR \$ORS \$\ 				
Auto-flush control	HANDLE->autoflush(EXPR) SOUTPUT_AUTOFLUSH \$		Last read file handle	\${^LAST_FH}			
Variables related to format							
Current value of the write() accumulator for format() lines.	• \$ACCUMULATOR • \$^A						
Form feed format. defaults to \f	IO::Handle->format_formfeed(EXPR) \$FORMAT_FORMFEED \$^L		Set of characters after which a string may be broken to fill continuation fields		at_line_break_characters EXPR _BREAK_CHARACTERS		

Number of lines left on the page on currently selected output channel	 HANDLE->format_lines_left(EXPR) \$FORMAT_LINES_LEFT \$-	Current page length of current output channel	HANDLE->format_lines_per_page(EXPR)\$FORMAT_LINES_PER_PAGE\$=				
Name of current top- page format of output channel	HANDLE->format_top_name(EXPR)\$FORMAT_TOP_NAME\$^	Report format name of output channel	 HANDLE->format_name(EXPR) \$FORMAT_NAME \$~ 				
• Error Variables	The variables \$@, \$!, \$^E, and \$? contain information about difference they correspond to errors detected by the Perl interpreter, C library						
Perl error from the last eval operator	• \$EVAL_ERROR • \$@	Current state of interpreter	• \$EXCEPTIONS_BEING_CAUGHT • \$^S				
Current value of C errno integer variable	• \$OS_ERROR • \$ERRNO • \$!	Hash of error names to 0 or 1, set to 1 if current error is this error.	 %OS_ERROR %ERRNO %!				
OS detected error	• \$EXTENDED_OS_ERROR • \$^E						
Status returned by last pipe close, backtick command, wait, waited, or system() call.	• \$CHILD_ERROR • \$?	native status returned by last pipe close , backtick command, wait() or wiatpid() or system() call	\${^CHILD_ERROR_NATIVE}				
Current value of warning switch	• \$WARNING • \$^W	Current set of warning checks enabled by the use warnings pragma	\${^WARNING_BITS}				
Variables related to the interpreter state	These variables provide information about the current interpreter s	tate.					
Flag associated with the -c switch	• \$COMPILING • \$^C	The current value of the debugging flags	• \$DEBUGGING • \$^D				
Current phase of the perl interpreter	\${^GLOBAL_PHASE}						
Compile-time hints for the perl interpreter. Internal use only	\$^H Values of compiled statements %^H						
Input/Output Layers. Internal use by PerllO only.	\${^OPEN}						
Debugging support. Internal variable.	• \$PERLDB • \$^P						
Taint mode	\${^TAINT}	Safe locale operations availability	\${^SAFE_LOCALES}				
Unicode Settings of Perl	\${^UNICODE}						
Internal UTF-8 offset caching code state	\${^UTF8CACHE}	State of UTF-8 locale detected by perl at startup.	\${^UTF8LOCALE}				
Deprecated and	\$# \$* \$[\${^ENCODING} \${^WIN32_SLOF}	PPY STAT}					

Perl 5 Statements

	Ton o dutaments ma
Conditional statements	
Loop statements	while (condition) { }until (condition) { }

Perl 5 Functions

Perl syntax	 To get information about a Perl function from the command line use the perldoc -f command. To get information about print use: perldoc -f print
! Cautionary notes	
 each keyword is broken Use Var::Pairs instead. 	Do NOT use the built-in each. It is broken, as described by Damian Conway in his Modern Perl Best Practice O'Reilly course , section control structure. • each is not re-entrant: • nested loops of each over the same hash does not work as expected and will create infinite loop since the nested loop each juts iterates from where the first loop each left it. • Exiting the loop leaves the state of the each internal pointer at the current location. • If you use each on the same hash later it will resume from where it left, it will not start form the beginning.
print functions	• <u>print</u> • <u>say</u> use feature qw(say); or use v5.10; (or higher). Like print, but implicitly appends a newline at the end of the list.
