Emacs support for the Erlang Programming Language

<u>Description</u>	<u>Keystroke</u>	Function	Note Note		
Erlang Support	Emacs supports Erlang via the				
See also: Erlang Reference Concise Guide To Erlang about-erlang Developing Erlang Code with PEL set PEL Erlang environment	The EDTS external packag The Isp-mode external pace Helm by using helm-Isp Treemacs by using Isp-I Origami by using Isp-origami	e de PEL activates it with peckage de PEL activates it we will peckage de PEL activates de	part of OTP PEL activates it with pel-use-erlang. pel-use-edts (set to t or start-automatically). with pel-use-erlang-ls. Uses the erlang ls Erlang LSP server. Integrates with: s with pel-use-helm-lsp. Value Integrates Integrates		
	The <u>Distel</u> external package also exists, but seems to have mainly been replaced by EDTS and needs maintenance. PEL does not support it. The <u>hide-comnt.el</u> external package. PEL activates it with pel-use-hide-comnt The <u>iedit external package</u> . PEL activates it with pel-use-iedit . The <u>smart-dash</u> external package. PEL activates it with pel-use-smart-dash . erlang-mode is in pel-modes-activating-smart-dash-mode . The <u>smartparens</u> external package. PEL activates it with pel-use-smartparens . Add it to pel-erlang-activates-minor-modes .				
• <u>∑ Customize</u>	► Useful global minor-modes to activate features in Erlang via pel-activates-global-minor-mode: show-paren-mode				
Identify minor modes to activate automatically in erlang-mode buffers	**Customization: **Type <f11> <f2> g followed by the group name and RET to open the specific customization group or one of the following key sequences. **pel-pkg-for-erlang:* to activate pel-use-erlang:* use <f11> SPC e <f2>, or <f12> <f2> from an Erlang buffer. This has sub-group:* pel-erlang-ide group to activate EDTS and LSP. **erlang:* when pel-use-erlang is on, use <f11> SPC e <f3> 1 **edts:* when pel-use-erlang is on, use <f11> SPC e <f3> 1 **lsp-erlang:* when pel-use-erlang-ls is on, use <f11> SPC e L <f3> 1 **lsp-mode:* when pel-use-erlang-ls is on, use <f11> SPC e L <f3> 2 The pel-pkg-for-erlang group has several user-options to control Erlang editing. Only some of them are described here. Use Emacs for the complete pel-erlang-shell-prevent-echo:* set to t to prevent the Erlang shell from echoing every command. **pel-erlang-environment group:* **pel-erlang-environment group:* **pel-erlang-man-parent-rootdir:* Identifies the parent directory of Erlang man directory. The man directory should hold the man1, man3, man4 a man6 which contain Erlang man files. If this is set PEL sets (override) the erlang-root-dir user-option value with it which activates the appropriate Erlang man files. Without PEL or if pel-erlang-man-parent-rootdir is nil, you must set the erlang-root-dir user-option yourself. **pel-erlang-exec-path:* Identifies the directory where Erlang binaries are stored. **pel-erlang-version-detection-method:* identifies a mechanism to detect Erlang/OTP version. By default it uses an Erlang script provided with F*pel-erlang-oede-style group: **pel-erlang-code-style group:* **pel-erlang-fill-column:* column where line-wrapping occurs:* maximum line length (defaults to 100). You can change the value or set it nil. **When pel-erlang-fill-column user option is nil, erlang-mode buffers use the Emacs fill-column value like other major modes. **pel-erlang-skel-use-secondary-separators:* whether line separators are used in Erlang code templates (see the Insert Erlang Code templates.)</f3></f11></f3></f11></f3></f11></f3></f11></f2></f12></f2></f11></f2></f11>				
• <u>∑ Speedbar</u>	PEL adds <u>∑ Speedbar</u> for	erl, .hrl and .escript Erlan	g files to show the list of functions.		
Open this PDF file. See also: <u>N Help/Info</u>	• <f11> SPC e <f1> • <f11> SPC e w <f1> • <f11> SPC e L <f1> • <f12> <f1> • <f12> <f1> • <f12> w <f1> • <f12> L <f1></f1></f12></f1></f12></f1></f12></f1></f12></f1></f11></f1></f11></f1></f11>	(pel-help-pdf & optional OPEN-WEB-PAGE)	Open the \$\text{NI} - \text{Erlang}\$ local PDF. If the prefix argument (like \$C-u\$ or \$M\$) is used, then it opens the remote GitHub hosted raw PDF instead. If the pel-flip-help-pdf-arg user-option is set it's the other way around. Skey sequences that start with \$<\f11 > SPC e are available from any major modes. Key sequences that start with \$<\f12 > \text{ are only available in erlang-mode buffers.} The \$<\f12 > \text{ keys sequences are mirrored by the \$<\mathbb{M} - \f12 > \text{ key sequence for convenience.}		
<u>∑ Customize</u> PEL Erlang support	<f11> SPC e <f2> <f12> <f2></f2></f12></f2></f11>	(pel-customize-pel &optional OTHER- WINDOW)	Customize PEL Erlang support: access PEL user-options to activate Erlang support packages. • If OTHER-WINDOW is non-nil (use C-u), display in another window.		
<u>∑ Customize</u> Emacs Erlang support	<f11> SPC e <f3> <f12> <f3></f3></f12></f3></f11>	(pel-customize-library &optional OTHER- WINDOW)	Customize Emacs Erlang support: erlang, erldoc, edts, auto-highlight-symbol, lsp-mode, lsp-ui, lsp-treemacs. • If OTHER-WINDOW is non-nil (use C-u), display in another window.		
<u>∑ Customize</u> PEL LSP for Erlang support	<f11> SPC e L <f2> <f12> L <f2></f2></f12></f2></f11>	(pel-customize-pel &optional OTHER- WINDOW)	Customize PEL LSP Erlang support If OTHER-WINDOW is non-nil (use C-u), display in another window. It is available when pel-use-erlang-ls is turned on.		
<u>Solution Services</u> Emacs LSP for Erlang support	<f11> SPC e L <f3> <f12> L <f3></f3></f12></f3></f11>	(pel-customize-library &optional OTHER- WINDOW)	Customize Emacs LSP Erlang support: Isp-erlang, Isp-mode, Isp-ui, helm-Isp, Isp-ivy, Isp-origami, Isp-treemacs. • If OTHER-WINDOW is non-nil (use C-u), display in another window. It is available when pel-use-erlang-Is is turned on.		
∑ Customize PEL LSP Window for Erlang support	<f11> SPC e w <f2> <f12> w <f2></f2></f12></f2></f11>	(pel-customize-pel &optional OTHER- WINDOW)	Customize PEL LSP Erlang support • If OTHER-WINDOW is non-nil (use C-u), display in another window. It is available when pel-use-treemacs and/or pel-use-tsp-treemacs is turned on.		
<u>∑ Customize</u> Emacs LSP Window for Erlang support	<f11> SPC e w <f3> <f12> w <f3></f3></f12></f3></f11>	(pel-customize-library &optional OTHER- WINDOW)	Customize Emacs LSP Erlang support: Isp-treemacs, treemacs • If OTHER-WINDOW is non-nil (use C-u), display in another window. It is available when pel-use-treemacs and/or pel-use-Isp-treemacs is turned on.		
Environment Help	Use the following command to	verify your Erlang environr	ment.		
Erlang Mode version	<f11> SPC e ?</f11>	(pel-show-erlang- version)	Display the following information in the minibuffer. f available Erlang system, of erlang.el, of erlang ls (if available), values of erlang-root-dir and pel-		
		erlang-man-parent-rootdir the erlang-man-parent-ro	Check that erlang-root-dir matches the version of Erlang you use. If not check the setting of ootdir . For more information see set PEL Erlang environment .		
Syntax Highlighting	The <u>erlang.el</u> external package provides several levels of Erlang code syntax highlighting: Off, Level 1: comments only, Level 2, Level 3, Level 4: maximum variety. There is not key binding for this. You must use the Syntax Highlighting section of the Erlang menu: In terminal mode Type <f10> to access the menu, then select Erlang, Syntax Highlighting and the level you want.</f10>				

<u>Description</u>	<u>Keystroke</u>	Function	<u>Note</u>		
Electric Keys for Erlang	Two different packages have an impact on the "electric" behaviour of some keys in erlang-mode buffers: 1. the erlang.el external package, which controls the behaviour of the RET, , , ; and > keys as controlled by the erlang-electric-commands variable. 2. the smartparens external package, which modifies the behaviour of the DEL and deletechar > behaviour when smartparens-mode is active. • Use f11> ((to toggle smartparens-mode on and off.				
<u>∑ Customize</u>	The pel-erlang-electric	customization and dynamic control of erlang.el electric key behaviour: erlang-electric-keys user-option set which of the RET, ,,; and > keys have electric behaviour. By default they are all activated. erlang-mode buffer, use the <f12> ~ prefix key followed by one of these keys to toggle the electric behaviour of the key.</f12>			
Toggle , electricity	<f12> ~ ,</f12>	(pel-erlang-comma)	Toggle electric behaviour of the comma key. Show message describing its new state.		
Toggle > electricity	<f12> ~ ></f12>	(pel-erlang-gt)	Toggle electric behaviour of the greater-than key. Show message describing its new state.		
Toggle RET electricity	<f12> ~ RET</f12>	(pel-erlang-newline)	Toggle electric behaviour of the newline key. Show message describing its new state.		
Toggle ; electricity	<f12> ~ ;</f12>	(pel-erlang-semicolon)	Toggle electric behaviour of the semicolon key. Show message describing its new state.		
Matching pairs • ∑X Smartparens	([{ "	When the smartparens external package is used and the smartparens-mode is active, the characters on the left are taken be part of a pair. The pairs are: (), [], {}, " ", 'i', and << >>. • When typing the first character of a pair, the rest of the pair is inserted and point is left inside. • To enclose a piece of text inside one of those pairs, mark the text area then type the first character of the pair. • The smartparens-mode can be activated automatically for Erlang by adding erlang-mode to the pel-erlang-activates-minor-modes user-option. • Use the <f11> ((key sequence to toggle the smartparens-mode on and off. • There's also the smartparens-strict-mode that imposes balanced pairs but that does not help much in Erlang.</f11>			
	<<				
New Line Electric behaviour: • indent next line	RET	The erlang-electric-	Break line at point. If electric behaviour is activated: indent, continuing comment if within one. • Should the current line begin with a comment, and the variable 'comment-multi-line' be non-nil, a new comment start is inserted. • Should the previous command be another electric command we assume that the user pressed newline out of old habit, hence we will do nothing. of this key is controlled by 2 variables: commands variable must include the erlang-electric-newline symbol to activate the electric		
Flashia		value is '(t): makes it	newline-criteria identifies how to check whether newline should behave electric. By default, the behave electric as soon as the erlang-electric-commands list includes erlang-electric-newline.		
Electric < • ∑x Smartparens	<	(erlang-electric-lt &optional ARG)	 Insert a less-than sign, and optionally mark it as an open paren. When smartparens-mode is active << automatically inserts the closing pair. 		
Electric >	>	(erlang-electric-gt	Insert a greater-than sign, and optionally insert a new line and indent.		
Electric behaviour: • new line & indent		&optional ARG)			
Electric comma Electric behaviour: new line & indent	,	• the erlang-electric-order (erlang-stop-when-in	Insert a comma character and possibly a new indented line when the comma is at the end of an Erlang expression. of this key is controlled by: comma-criteria states a list of criteria to determine whether to indent next line or not. Its default is: nside-argument-list erlang-stop-when-at-guard erlang-next-lines-empty-p erlang-at-keyword-end-		
Electric semicolon Electric behaviour: • insert clause function header	;	(erlang-electric-semicolon &optional ARG) • The erlang-electric-semicolon & Grand & G	Insert a semicolon character and possibly a <u>function clause head</u> prototype on the next line. • Behaves just like the normal semicolon when supplied with a numerical arg, point is inside string or comment, or when there are non-whitespace characters following the point on the current line. • Inserts a function clause head prototype when the selection criteria identified by erlangelectric-comma-criteria indicates that it should be done. micolon-criteria defaults to (erlang-stop-when-inside-argument-list erlang-stop-when-at-guard		
			r-p erlang-at-keyword-end-p erlang-at-end-of-clause-p erlang-at-end-of-function-p). olon-insert-blank-lines' user-option controls number of blank lines inserted between the current eader.		
Delete forward, jump over block pair until block is empty then delete block • <u>**** Smartparens</u> with smartparensmode active	• <deletechar> • 🗵</deletechar>	(sp-delete-char &optional ARG)	Delete a character forward or move forward over a delimiter. If on an opening delimiter, move forward into balanced expression. If on a closing delimiter, refuse to delete unless the balanced expression is empty, in which case delete the entire expression. If the delimiter does not form a balanced expression, it will be deleted normally. With a numeric prefix argument N > 0, delete N characters forward. With a numeric prefix argument N < 0, delete N characters backward. With a numeric prefix argument N = 0, simply delete a character forward, without regard for delimiter balancing. If ARG is raw prefix argument C-u, delete characters forward until a closing delimiter whose deletion would break the proper pairing is hit.		
Standard delete forward character		(delete-forward-char N &optional KILLFLAG)	Delete the following N characters (previous if N is negative). If Transient Mark mode is enabled, the mark is active, and N is 1, delete the text in the region and deactivate the mark instead. To disable this, set variable 'delete-active-region' to nil. Optional second arg KILLFLAG non-nil means to kill (save in kill ring) instead of delete. Interactively, N is the prefix arg, and KILLFLAG is set if N was explicitly specified. When killing, the killed text is filtered by 'filter-buffer-substring' before it is saved in the kill ring, so the actual saved text might be different from what was killed.		
Delete backward, jump over block pair until block is empty then delete block • **Smartparens** with smartparens-mode active	• DEL • ≪	(sp-backward-delete- char &optional ARG)	 Delete a character backward or move backward over a delimiter. If on a closing delimiter, move backward into balanced expression. If on a opening delimiter, refuse to delete unless the balanced expression is empty, in which case delete the entire expression. If the delimiter does not form a balanced expression, it will be deleted normally. With a numeric prefix argument N > 0, delete N characters backward. With a numeric prefix argument N < 0, delete N characters forward. With a numeric prefix argument N = 0, simply delete a character backward, without regard for delimiter balancing. If ARG is raw prefix argument C-u, delete characters backward until a opening delimiter whose deletion would break the proper pairing is hit. 		
Standard delete backward character	• DEL • ⟨⊠	(backward-delete-char- untabify ARG &optional KILLP)	Delete characters backward, changing tabs into spaces. • The exact behavior depends on 'backward-delete-char-untabify-method'. • Delete ARG chars, and kill (save in kill ring) if KILLP is non-nil. • Interactively, ARG is the prefix arg (default 1) and KILLP is t if a prefix arg was specified.		

<u>Description</u>	<u>Keystroke</u>	Function	<u>Note</u>	
Erlang Comments Comments @ Erlang Programming Rules & Conventions See also: Comments	% - Single percent%% - Two percent c%%% - Three percent	t characters for comments lo characters are used for comments characters are used to des	uses the following conventions: cocated toward the end of a line of code ments starting at indentation level. cribe modules and are always placed in the first column by the comment-column variable. Set it with comment-set-column, bound to C-x;	
Comment/un-comment PEL extension of comment-dwim	M-;	(comment-dwim ARG) (pel-erlang-comment-dwim &optional ARG)	Comment line or region with % or %% style comments depending on the location in the buffer. Does the same but adds ability to insert %%% comments. It does that on the very first line in the buffer and lines that follow a line that starts with %%%.	
specialized for Erlang. Automatically uses the %%% comment when appropriate. ** Note: • M-; works much	With marked un-commente With marked commented re	d no comment: On empty On first em On line wit d region: Comment region gion: Un-comments the	line: insert %% comment starter at the proper indentation level. apty line in buffer: insert %%% comment. Also following lines or region that starts with %%% h code: insert % comment starter after the code for an end-of-line comment (each line is commented)	
better than C-c C-c and C-c C-u • PEL maps M-; to	• The M-; binding to c	omment-dwim works just as	However PEL uses M-1 for something else. s indent-for-comment if nothing is marked.	
pel-erlang-comment- dwim which works even better.	C-c C-c	(comment-region BEG END &optional ARG)	Comment or uncomment each line in the region. • With just C-u prefix arg, uncomment each line in region BEG END. • Numeric prefix ARG means use ARG comment characters. • If ARG is negative, delete that many comment characters instead.	
See also: Comments	By default, the 'comment-s	start' markers are inserted a	d 'comment-padding'; the comment end by 'comment-end' and 'comment-padding'. It the current indentation of the region, and comments are terminated on each line (even for nd blank lines do not get comments). This can be changed with 'comment-style'.	
Un-comment region	C-c C-u	(uncomment-region BEG END &optional ARG)	Uncomment each line in the BEG END region. The numeric prefix ARG can specify a number of chars to remove from the comment delimiters.	
Toggle display of comments in buffer or active region See also: Comments	<f11> ; ;</f11>	(hide/show-comments- toggle &optional START END)	Toggle hiding/showing of comments in the active region or whole buffer. • If the region is active, then toggle comments in the region. Otherwise, in the whole buffer. • Requires the https://doi.org/like/hide-commt-nlike/https://doi.org/like/hide-commt-nlike/hide-	
Filling Text See also: Filling/Justification	 Text wrapping and filling applies to all text in the Erlang buffer: code and comment. The auto-fill command will automatically wraps code and comments. Filling Erlang code does not work as it treats code as normal text. But filling comment paragraphs is useful. The fill-column variable controls where text wraps. pel-show-fill-column <f11> t f ? shows its value. Use set-fill-column (C-x f) to set it. Toggle a vertical line that shows it with <f11> 8.</f11></f11> 			
Fill current paragraph	• M-q • <f11> t f p</f11>	(fill-paragraph &optional JUSTIFY REGION)	Fill multi-line comment at or after point. To justify as well: C-u M-q In auto fill mode the text filling is done at the end of the line.	
Indentation		,	the CC-Mode logic and provided commands listed below. and at the end of this list. They are also listed in the <u>Indentation</u> table.	
Indent current line or region	<tab></tab>	(indent-for-tab- command &optional ARG)	Indent active region, current line, or block starting on this line.	
See also: Indentation Erlang Guidelines: Ericsson AB: try to limit most code to 2 levels of indentation. Inaka: indentation level = 2 space chars.	 The indentation level is controlled by the erlang-indent-level user-option. Its default is 4. Access its custom group buffer using <f12> <f3> 1 or <f11> SPC e <f3> 1. Or use <f11> <f2> g erlang RET.</f2></f11></f3></f11></f3></f12> <tab> performs syntactic indentation.</tab> In Transient Mark mode, when the region is active, reindent the region. Otherwise, with a prefix argument, rigidly reindent the expression starting on the current line. Otherwise reindent just the current line. 			
Indent complete buffer	<f12> <tab></tab></f12>	(erlang-indent-current- buffer)	Indent current buffer as Erlang code. • Works on the entire buffer, even if it is narrowed.	
Indent Erlang function	C-c C-q <f12> f <tab></tab></f12>	(erlang-indent-function)	Indent current Erlang function. Point can be located anywhere inside the function.	
Indent function clause	<f12> c <tab></tab></f12>	(erlang-indent-clause)	Indent current Erlang clause. Point can be located anywhere in the Erlang clause.	
Indent lines of list after point See also: <u>∑ Indentation</u>	С-м-q	(prog-indent-sexp &optional DEFUN)	Indent the expression after point. When interactively called with prefix, indent the enclosing function instead.	
Indent a region	C-M-\	(indent-region START END &optional COLUMN)	 Indent each nonblank line in the region. A numeric prefix argument specifies a column: indent each line to that column. With no prefix argument, the command chooses one of these methods and indents all the lines with it: If 'fill-prefix' is non-nil, insert 'fill-prefix' at the beginning of each line in the region that does not already begin with it. If 'indent-region-function' is non-nil, call that function to indent the region. Indent each line via 'indent-according-to-mode'. When a region is marked you can also use the simple <tab> to do the same when syntactic-indentation is active.</tab> 	

<u>Description</u>	<u>Keystroke</u>	Function	<u>Note</u>				
Navigation in Erlang code See also: • <u>Navigation</u> • Moving by Defuns	The erlang-mode provides commands to navigate across Erlang source code. PEL complements these. And EDTS also. Several commands are specialization of the normal navigation commands which are described in the table Navigation, but several are specific to Erlang: Notice the 3 sets of commands: 1. <f12> <up> and <f12> <down> move to the beginning of Erlang functions skipping all compiler directives. 2. The standard navigation commands, (mapped to <f6> prefix) move to beginning/end of Erlang functions but stop at compiler directives. 3. The <f12> <m-cursor> commands (also accessible via <m-f12> <m-cursor>, move across Erlang clauses (as opposed to functions). The list below describe the specialized commands only. See the others inside Navigation, like the navigation by blocks.</m-cursor></m-f12></m-cursor></f12></f6></down></f12></up></f12>						
	·	 Note that all <f12> prefixes shown below are available in erlang-mode. Their global equivalent is <f11> SPC e. It is not always shown for brevity.</f11></f12> Some navigation examples use icons to represent point position. The start position is shown as unit following positions as to to . 					
By <u>Function</u>	Move to next/previous functions	tion beginning/end at/skippi	ng compiler directives. Skips clauses.				
to start of function	Move to beginning of fun						
 Go backward to beginning of previous function 	• <f12> <up> • <f12> f p • <f11> SPC e <up></up></f11></f12></up></f12>	(pel-previous-erl- function &optional N)	 Move backward to the beginning of the previous function skipping all compiler directives. Moves point to the first character of the function name. With prefix argument N repeat N times. Pushes mark; move back to previous position with M-\[^\]. 				
	• <f11> SPC e f p</f11>		Shift marking is available for the key sequence using a cursor key.				
	C-c C-d C-b	(ferl-goto-previous- function)	Move backward to the beginning of the previous function. • Skips all compiler directives. • Requires EDTS 2 PEL activates it with pel-use-edts (set to t or start-automatically).				
Go forward to beginning of next function	• <f12> <down> • <f12> f n</f12></down></f12>	(pel-next-erl-function &optional N)	Move forward to the beginning of the next function skipping all compiler directives. • Moves point to the first character of the function name. • With prefix argument N repeat N times.				
	• <f11> SPC e <down> • <f11> SPC e f n</f11></down></f11>		• Pushes mark; move back to previous position with M— . Shift marking is available for the key sequence using a cursor key.				
	C-c C-d C-f	(ferl-goto-next-function)	Move forward to the beginning of the next function. • Skips all compiler directives. PEL activates it with pel-use-edts (set to t or start-automatically).				
to start of function/ directive	Move to beginning of fun	ction or compiler directive					
Go backward to beginning of	<f12> f P</f12>	(beginning-of-defun &optional ARG)	Move backward to the beginning of an Erlang function or compiler directive. • With ARG, do it that many times. Negative ARG means move forward to the ARGth following				
previous: function compiler directive	• C-M-a • C-M- <home> • <f6> p • <f6> <up> • <f11> SPC e f P</f11></up></f6></f6></home>	(erlang-beginning- of-function &optional ARG)	beginning of defun. →Shift marking is available in graphics mode, not in terminal mode (for C-M-a and C-M- <home>). However<f6> p and <f6> <up> handle Shift-marking fine in terminal mode. →Erlang.el man page indicates an invalid mapping for this.</up></f6></f6></home>				
Go forward to	<f12> f N</f12>	(pel-beginning-of-next-	Move forward to the beginning of the next function definition or compiler directive.				
beginning of next:	• <f6> n • <f6> <down> • <f11> SPC e f N</f11></down></f6></f6>	defun &optional SILENT DONT-PUSH_MARK)	 Beeps if does not find beginning of next function unless SILENT is non-nil. If the beginning of next function is found, push the start location to the mark ring unless DONT-PUSH_MARK is non-nil. Move back to previous position with M-`. Shift marking is available for the <f6> bindings.</f6> 				
to end of function	Move to end of function of	or compiler directive					
Backward to end of previous: function compiler directive	<f6> <left></left></f6>	(pel-end-of-previous- defun & optional SILENT DONT-PUSH_MARK)	Move backwards to line after end of the previous function definition. • Beeps if does not find end of previous function unless SILENT is non-nil. • If the end of previous function is found, push the start location to the mark ring unless DONT-PUSH_MARK is non-nil. • Move back to previous position with M−`. ★Shift marking is available for the <f6> bindings.</f6>				
Forward to end of next: function compiler directive	• C-M-e • C-M- <end> • <f6> <right></right></f6></end>	(end-of-defun &optional ARG) (erlang-end-of- function &optional ARG)	Move forward to line after end of Erlang function. With argument, do it that many times. Negative argument -N means move back to Nth preceding end of defun. ➡ Shift marking is available in graphics mode, not in terminal mode (for C-M-e and C-M- <end>>). However <f6> <right> handle Shift-marking fine in terminal mode.</right></f6></end>				
By <u>Expression</u> functions, etc	The following commands mov • They do not move across ex	e to the beginning/end of six epressions in a sequence of	sequence ends with a period. Expressions in expression sequences are separated by commas. Ingle expression or expression sequence. expressions. Ission, these commands move across function definitions.				
Go to beginning of statement	м-а	(backward-sentence	Go backward to the beginning of an Erlang statement.				
statement	<f12> s a</f12>	&optional ARG)	With a numerical argument repeat that many times.				
Go to end of statement	M-e <f12> s e</f12>	(forward-sentence &optional ARG)	Go forward to the end of an Erlang statement. • With a numerical argument repeat that many times.				
By <u>Function Clause</u>	Move by clauses of a function	. A function definition (state	ment) may have multiple clauses, each separated by a semicolon.				
Go backward to beginning of clause	• C-c M-a • <f12> c a • <m-f12> <m-up></m-up></m-f12></f12>	(erlang-beginning-of- clause &optional ARG)	Move backward to previous start of clause. • With argument, do this that many times. Erlang.el man page indicates an invalid mapping for this. Reported as ERL-1314.				
Go forward to beginning of next clause	• <f12> c n • <m-f12> <m-down></m-down></m-f12></f12>	(pel-beginning-of-next- clause)	Move forward to the beginning of next clause. • Pushes mark; move back to previous position with M−`. → Shift marking is available.				
Go backward to end of previous clause	• <f12> c p • <m-f12> <m-left></m-left></m-f12></f12>	(pel-end-of-previous- clause)	Move backward to the end of the previous clause. • Pushes mark; move back to previous position with M−ˆ. ⇒Shift marking is available.				
Go forward to end of current clause	• C-c M-e • <f12> c e • <m-f12> <m-right></m-right></m-f12></f12>	(erlang-end-of-clause &optional ARG)	Move to the end of the current clause. • With argument, do this that many times. • Erlang.el man page indicates an invalid mapping for this. Reported as ERL-1314.				

Description	<u>Keystroke</u>	Function	<u>Note</u>		
Block Navigation	Erlang syntax uses balanced blocks made out of the following character pairs, generically called block parens: • () for function parameters, expression grouping • { } for tuples, records, maps • [] for lists • " " for strings				
See also: • <u>∑</u>	 for <u>binaries and bitstrings</u>				
	 Use the <f11> ((key sequence to toggle the smartparens-mode on and off.</f11> Standard Erlang support provide some commands to navigate across and into these balanced blocks. Their name is shown in black in the Other commands are provided by \$\infty\$ \$\infty\$ Smartparens when smartparens-mode minor-mode is active. Some are PEL specializations of seconds. 				
To Block start/end	<u> </u>		f a block, skipping over Erlang terms inside these blocks.		
Go backward to	• C-M-p	(backward-list &optional			
beginning of previous block • Skips terms.	-	ARG)	 Supports blocks of (), [] and {}. With ARG, do it that many times. A negative argument N means forward-list N. This command assumes point is not in a string or comment. 		
			<pre>-spec ejabberd_started6() -> ok. ejabberd_started5() -> gen_server:call4(?MODULE, ejabberd_started, ?CALL_TIMEOUT).</pre>		
			<pre>-spec config_reloaded3() -> ok. config_reloaded2() -> gen_server:call1(?MODULE, config_reloaded, ?CALL_TIMEOUT).0</pre>		
Go backward to end of previous block Skips terms. ∑X Smartparens	<m-f7> p</m-f7>	(pel-sp-previous-sexp &optional ARG)	Move backward to end of previous block. With ARG, do it that many times. If there is no next expression at current level, jump one level up (effectively doing 'sp-up-sexp'). A negative argument N means move to the end of N-th following balanced expression.		
with smartparens- mode active			<pre>-spec ejabberd_started() 6 -> ok. ejabberd_started() 5 -> gen_server:call(?MODULE, ejabberd_started, ?CALL_TIMEOUT) 4.</pre>		
			<pre>-spec config_reloaded()3 -> ok. config_reloaded()2 -> gen_server:call(?MODULE, config_reloaded, ?CALL_TIMEOUT)1.0</pre>		
Go forward to end of next block Skips terms.	• C-M-n	(forward-list &optional ARG)	Move forward to end of next block. • Supports blocks of (), [] and {}. • With ARG, do it that many times. • A negative argument N means forward-list N. • This command assumes point is not in a string or comment.		
			<pre>0-spec ejabberd_started()1 -> ok. ejabberd_started()2 -> gen_server:call(?MODULE, ejabberd_started, ?CALL_TIMEOUT)3.</pre>		
			<pre>-spec config_reloaded()4 -> ok. config_reloaded()5 -> gen_server:call(?MODULE, config_reloaded, ?CALL_TIMEOUT)6.</pre>		
Go forward to beginning of next block Skips terms. The prostructure of the control of the cont	<m-f7> n</m-f7>	(pel-sp-next-sexp &optional ARG)	Move forward to beginning of next block (and term if 'sp-navigate-consider-symbols' is set). With ARG, do it that many times. If there is no next expression at current level, jump one level up (effectively doing 'sp-backward-up-sexp').		
<u>X Smartparens</u> with smartparens- mode active			<pre>0-spec ejabberd_started1() -> ok. ejabberd_started2() -> gen_server:call3(?MODULE, ejabberd_started, ?CALL_TIMEOUT).</pre>

<u>Description</u>	<u>Keystroke</u>	Function	<u>Note</u>
Copy and Clone	· ·		cloning operations. They are provided by <u>X Smartparens</u>
S Smartparens Copy current & forward			lay the copied string when pel-show-copy-cut-text is t . Toggle this display with <f11> M-=</f11> Copy the following APG expressions to the kill ring
Copy current & forward block(s)	<m-f7> =</m-f7>	(sp-copy-sexp &optional ARG)	Copy the following ARG expressions to the kill-ring. This is exactly like calling 'sp-kill-sexp' with second argument t. All the special prefix arguments work the same way.
Copy previous block(s)	<m-f7> M-=</m-f7>	(sp-backward-copy- sexp &optional ARG)	Copy the previous ARG expressions to the kill-ring. This is exactly like calling 'sp-backward-kill-sexp' with second argument t. All the special prefix arguments work the same way.
clone current block	<m-f7> c</m-f7>	(sp-clone-sexp)	Clone sexp after or around point. If the form immediately after point is a sexp, clone it below the current one and put the point in front of it. Otherwise get the enclosing sexp and clone it below the current enclosing sexp.
Edit Erlang Code	The following commands help	edit Erlang code.	
Create additional clause	C-c C-j	(erlang-generate-new-clause)	Create additional Erlang clause header. Parses the source file for the name of the current Erlang function. Create the header containing the name, a pair of parentheses, and an arrow. The space between the function name and the first parenthesis is preserved. The point is placed between the parentheses.
Clone clause arguments	С-с С-у	(erlang-clone- arguments)	Insert, at the point, the argument list of the previous clause. Copy the function arguments of the preceding Erlang clause. This command is useful when defining a new clause with almost the same argument as the preceding. The mark is set at the beginning of the inserted text, the point at the end.
Transform code	The following two commands	from the ∑X Smartparens €	external package help manipulate Erlang code with blocks.
Align arrows inside region	C-c C-a	(erlang-align-arrows START END)	Align arrows ("->") in function clauses inside marked region or in the current function. • With a prefix argument , aligns all arrows in the region (or from beginning of buffer up to point), not just those in function clauses.
		Before: sum(L) -> s sum([H T], Sum) -> s sum([], Sum) -> Sum.	
		To align something else than clauses, select the code and type: C-u C-c C-a	<pre>Before:</pre>
Transpose block	<m-f7> t</m-f7>	(sp-transpose-sexp	end; end; Transpose the expressions around point.
elements • ∑X Smartparens		&optional ARG)	 The operation will move the point after the transposed block, so the next transpose will "drag" it forward. With arg positive N, apply that many times, dragging the expression forward. With arg negative -N, apply N times backward, pushing the word before cursor backward. This will therefore not transpose the expressions before and after point, but push the
with smartparens- mode active			expression before point over the one before it. Before (for all following examples): AList = [1, 2, 3, [10,11,12,[22,33,44]], 5, 6, 7, 8,[]].
			After <m-f7> t: AList = [1, 2, [10,11,12,[22,33,44]], 3 , 5, 6, 7, 8,[]]. After M-2 <m-f7> t: AList = [1, 2, [10,11,12,[22,33,44]], 5, 3 , 6, 7, 8,[]].</m-f7></m-f7>
			<pre>Before (for all following examples): AList = [{first,[1, 2, 3]} , [10,11,12,[22,33,44]], 5, 6, 7, 8,[]]. After <m-f7> t: AList = [[10,11,12,[22,33,44]], {first,[1, 2, 3]} , 5, 6, 7, 8,[]].</m-f7></pre>
			After M-2 <m-f7> t: AList = [[10,11,12,[22,33,44]], 5, {first,[1, 2, 3]}, 6, 7, 8,[]]. Before (for all following examples):</m-f7>
			Alist = [{first,[1, 2, 3]} , [10,11,12,[22,33,44]], 5, 6, 7, 8,[]]. After M <m-f7> t: AList = [{first,[1, 3 , 2]}, [10,11,12,[22,33,44]], 5, 6, 7, 8,[]].</m-f7>
Push current block after next	<m-f7> s</m-f7>	(sp-push-hybrid-sexp)	Push the hybrid sexp after point over the following one.
X Smartparens with smartparens- mode active			Before: AList = [1, 2, 3,
Transform - slurp	The following commands perfo	orm slurping operations, how	wever support for Erlang could be improved as the commands do not always work properly.
Enclose next outside element into current block • ∑X Smartparens with smartparens-mode active ₩	<m-f7> ></m-f7>	(sp-forward-slurp-sexp &optional ARG)	 Add sexp following the current list in it by moving the closing delimiter. If the current list is the last in a parent list, extend that list (and possibly apply recursively until we can extend a list or end of file). If ARG is N, apply this function that many times. If ARG is negative -N, extend the opening pair instead (that is, backward). If ARG is raw prefix C-u, extend all the way to the end of the parent list. If both the current expression and the expression to be slurped are strings, they are joined together.
			 ⚠ This command does not always work well for Erlang as shown in the first example. Use the next command for Erlang in those cases. Before: After <m-£7> >:</m-£7>
			Names = []Joe. Names = [Joe.] & Before: AList = [[1, 2, 3], 4, 5]. After <m-f7> >:</m-f7>
			AList = [[1, 2, 3 4,], 5]. % *** Before: AList = [1, 2, 3, After M < M-f7 > >:
			[10,11,12,[22,33,44]], AList = [1, 2, [3, 5, 6, 7, 8,[]].
	<m-f7> M-></m-f7>	(sp-slurp-hybrid-sexp)	This commands works a little differently and handles some Erlang statement better, but not all. Before: After <m-f7> M->:</m-f7>
			Before: After <m-f7> M->: Names = []Joe . Names = []Joe]. Before: After <m-f7> M->:</m-f7></m-f7>
			AList = [[1, 2, 3]], 4, 5]. AList = [[1, 2, 3 4], 5]. Alist = [[1, 2, 3 4], 5]. %

Description	<u>Keystroke</u>	Function	<u>Note</u>
Enclose previous outside element(s) into next block	<m-f7> <</m-f7>	(sp-backward-slurp- sexp &optional ARG)	Add the sexp preceding the current list in it by moving the opening delimiter. If the current list is the first in a parent list, extend that list (and possibly apply recursively untive can extend a list or beginning of file). If arg is N, apply this function that many times. If arg is negative -N, extend the closing pair instead (that is, forward). If ARG is raw prefix C-u, extend all the way to the beginning of the parent list. If both the current expression and the expression to be slurped are strings, they are joined together.
		The position of point inside the list does not matter. The point does not move.	Before: After <m-f7> <:</m-f7>
		Before: AList = [-2, -1, 0,	After C-u <m-f7> <: 1, [2, 3, 4], 5]. AList = [[-2, -1, 0, 1, 2, 3, 4]], 5].</m-f7>
Enclose next element(s) into previous block • <u>XX Smartparens</u> with smartparensmode active	<m-f7>]</m-f7>	(sp-add-to-previous- sexp &optional ARG)	Add the expression around point to the first list preceding point. With ARG positive N add that many expressions to the preceding list. If ARG is raw prefix argument C-u add all expressions until the end of enclosing list to the previous list. If ARG is raw prefix argument C-u C-u add the current list into the previous
• <u>.1.</u> ‡##		This command does not seem to work properly for Erlang as shown by the following examples:	Before: AList = [0, 1, [2, 3], 4, 5]. Before: AList = [0, 1, [2, 3], 4, 5]. After M-2 < M-f7>]: AList = [0, 1, [2, 3], 4, 5]. After M-2 < M-f7>]: AList = [0, 1, [2, 3], 4, 5].
Enclose previous outside element(s) into next block • **\sum x \text{ Smartparens} with smartparens-	<m-f7> [</m-f7>	(sp-add-to-next-sexp &optional ARG)	Add the expressions around point to the first list following point. With ARG positive N add that many expressions to the following list. If ARG is raw prefix argument C-u add all expressions until the beginning of enclosing list to the following list. If ARG is raw prefix argument C-u C-u add the current list into the following list.
mode active		This command works fine in Erlang for the following code examples:	AList = [1, 2, [3, 4]]. AList = [1, [2, 3, 4]].
			Before: AList = [1, 2, [3, 4]]. Alist = [1, 2, [3, 4]]. After C-u <m-f7> [: After C-u C-u <m-f7> [:</m-f7></m-f7>
			AList = [[1, 2], [3, 4]]. AList = [[[1, 2], 3, 4]].

from current/next block • St Smartparens		&optional ARG)	With ARG N, unwrap Nth expression as returned by 'sp-forward-sexp'. If ARG is negative -N, unwrap Nth expression backwards as returned by 'sp-backward-sexp'.
with smartparens- mode active		This command works fine in Erlang for the following code examples:	AList = ({[1, 2, 3, 4]}). AList = [{1, 2, 3, 4}]. Before: After <m-f7> U:</m-f7>
		<pre>Before: AList = [1, 2, [3,</pre>	AList = ({[1, 2, 3, 4]}). AList = ({1, 2, 3, 4}). After <m-f7> U: 4], 5, [6, 7], 8]. AList = [1, 2, 3, 4, 5, [6, 7], 8].</m-f7>
		Before: AList = [1, 2, [3,	After M-2 <m-f7> U:</m-f7>

Description	<u>Keystroke</u>	Function	Note
Extract all elements from previous block	<m-f7> W</m-f7>	(sp-backward-unwrap- sexp &optional ARG)	Unwrap the previous block. Unwrap the previous expression.
<u>Standard Standard</u> with smartparensmode active			With ARG N, unwrap Nth expression as returned by 'sp-backward-sexp'. If ARG is negative -N, unwrap Nth expression forward as returned by 'sp-forward-sexp'.
			Before: After <m-f7> W: AList = ({[1, 2, 3, 4]}). AList = ({1, 2, 3, 4}).</m-f7>
		code examples:	Again After <m-f7> W: AList = (1, 2, 3, 4).</m-f7>
			Again After <m-f7> W: AList = 1, 2, 3, 4.</m-f7>
			Before: AList = [0, 1, [2, 3, 4], 5]. After <m-f7> W: List = [0, 1, 2, 3, 4, 5].</m-f7>
		Before: AList = [1, 2, [3, 4	After <m-f7> W: 1], 5, [6, 7], 8]. AList = [1, 2, [3, 4], 5, 6, 7, 8].</m-f7>
0.100.10		Before: AList = [1, 2, [3, 4	After M-2 <m-f7> W: 1], 5, [6, 7], 8]. AList = [1, 2, 3, 4, 5, [6, 7], 8].</m-f7>
Split & Join			
• <u>∑</u> x Smartparens with smartparens-	<m-f7> </m-f7>	(sp-split-sexp ARG)	 Split the list or string the point is on into two. If ARG is a raw prefix C-u split all the sexps in current expression in separate lists enclosed with delimiters of the current expression.
mode active		Before: AList = [1, 2, [3, 4	After <m-f7> : 4, 5, 6, 7], 8]. AList = [1, 2, [3, 4,] [5, 6, 7], 8]. %</m-f7>
		Before: Name = "Joe Armstro	After <m-f7> : ng". Name = "Joe" "Armstrong".</m-f7>
		Before:	After C-u <m-f7> :</m-f7>
		AList = [1, 2, [3, 4	
Join blocks • ∑X Smartparens with smartparens- mode active	<m-f7> J</m-f7>	(sp-join-sexp &optional ARG)	Join the blocks before and after point if they are of the same type. If ARG is positive N, join N expressions after the point with the one before the point. If ARG is negative -N, join N expressions before the point with the one after the point. If ARG is a raw prefix C-u join all the terms up until the end of current expression. The joining stops at the first expression of different type.
		Before: AList = [0, 1, [2, 3	After <m-f7> J: 3, 4], [5, 6], 7]. AList = [0, 1, [2, 3, 4], 5, 6], 7].</m-f7>
		Before: AList = [[0, 1]], [2	After M-2 <m-f7> J: 2, 3, 4], [5, 6], 7]. AList = [[0, 1], 2, 3, 4, 5, 6], 7].</m-f7>
Search Support			snake case is often used. Using superword-mode helps searching. ode. To change this use the <f11> t <f2> to access the customize buffer.</f2></f11>
Toggle superword-mode See also:	<f12> M-p • <f11> t m p • <f11> SPC e M-p</f11></f11></f12>	(superword-mode &optional ARG)	Toggle superword-mode: a minor mode that treats <u>snake_case</u> as one word. In Erlang, '_' are treated as part of words. • With a prefix argument ARG, enable superword mode if ARG is positive, and disable it otherwise.
• <u>∑ Text Modes</u> • <u>∑ Search/Replace</u>			PEL provides the <f12> M-p key for the programming language modes where <pre>snake case</pre> is popular (Emacs Lisp, C, C++, Erlang, Python, etc)</f12>
Marking	For those 2 commands the	Erlang.el man page indicate	available. They complement what is already available and described in the <u>Narking</u> table. es an invalid mapping for this. Reported as <u>ERL-1314</u> .
Mark Erlang function	• C-M-h • <f12> f m</f12>	(mark-defun & optional ARG) (erlang-mark-function & optional ARG)	 Put mark at end of this function, point at beginning. The function marked is the one that contains point or follows point. With positive ARG, mark this and that many next functions; with negative ARG, change the direction of marking. If the mark is active, it marks the next or previous function(s) after the one(s) already marked.
Mark Erlang Clause	• C-c M-h • <f12> c m</f12>	(erlang-mark-clause)	Put mark at end of clause, point at beginning.
iEdit mode See also: <u>∑ Highlight</u>	iEdit Mode - Edit multiple ins Requires the iedit external		s simultaneously. So This mode is very useful to rename symbols or variable during refactoring. it with pel-use-iedit.
Toggle iedit mode	• C-;	(iedit-mode &optional	Toggle iEdit mode: edit all symbols in scope or region simultaneously.
See also: • <u>> Cursor</u> • <u>> Search/Replace</u>	• <f11> e • <f11> h i • <f11> m i</f11></f11></f11>	ARG)	 ▶ Both iEdit and Flyspell use the C-; key as their default binding. PEL detects and reports that situation: modify the binding of one of them if you see it. ➤ See ∑ Search/Replace where all the iedit-mode commands are described.
Highlighting blocks	show-paren-mode, which h	ighlights the parens that ma	e useful modes to highlight blocks of (), {}, and []. tches the one before or after point. as are highlighted with the same colour.
Toggle show-paren mode on/off	• <f12> M-9 • <m-f12> M-9</m-f12></f12>	(show-paren-mode &optional ARG)	Toggle visualization of matching parens (Show Paren mode). • With a prefix argument ARG, enable Show Paren mode if ARG is positive, and disable it otherwise.
See also: <u>Nighlight</u>	• <f11> h (• <f11> SPC e M-9</f11></f11>		Show Paren mode is a global minor mode. When enabled, any matching parenthesis is highlighted in 'show-paren-style' after 'show-paren-delay' seconds of Emacs idle time.
Enable/Disable coloured highlight of nested blocks (),{},[]	• <f12> M-r • <m-f12> M-r</m-f12></f12>	(rainbow-delimiters- mode &optional ARG)	Highlight nested parentheses, brackets, and braces with different colours according to their depth. • Customize the depth and colours with M-x customize-group rainbow-delimiters
See also: <u>National Highlight</u>	• <f11> h R • <f11> SPC e M-r</f11></f11>		Requires: rainbow-delimiters.el PEL activates this when the pel-use-rainbow-delimiters user option is set to t.
Inserting code with	Specialized <u>Tempo</u> <u>Skel</u>	etons	
Insert Parentheses	M-((insert-parentheses	For Erlang: insert a parenthesis pair '()', leaving point after open-paren.
		&optional ARG)	 A positive ARG encloses the following ARG sexps in parenthesis if they are balanced. A negative ARG encloses the preceding ARG sexps instead. No argument is equivalent to zero: just insert '()' and leave point between. PEL makes 'parens-require-spaces' buffer local and set it to nil in Erlang mode buffers, allowing the use of this command to insert the argument parentheses following a function (and without placing a space between the function name and the opening parenthesis. If region is active, insert enclosing characters at region boundaries.
			This command assumes point is not in a string or comment.

<u>Description</u>		<u>Keystroke</u>	Function	Note
Insert Erlang Cod	le			tons using the standard tempo skeleton package. the Erlang/Skeletons menu (via <f10>).</f10>
Templates		PEL provides the following a	additional functionality:	
See also: Solve the series in	nr.			ed under the pel:erlang-skel key prefix: <f12> <f12>. h a +. These are also added to the menu.</f12></f12>
more info and	Л			Style is controlled by the user options inside the pel-erlang-code-style group. The controlled
information about tempo skeleton and	I	erlang mode buffer and ir	nclude the following options	
the completely different yasnippet		pel-erlang-skel-inserpel-erlang-skel-prom		: set whether an automatically updated timestamp is inserted in the file header block. : set whether file and function skeletons blocks prompt for purpose and insert it.
template-based texinsertion).	t	pel-erlang-skel-prom pel-erlang-skel-prom		: set whether function skeletons prompt for function name and then inserts that name. s : set whether function skeletons prompt for function arguments and then insert them.
moortion).		 pel-erlang-use-separ 	ators	: set whether blocks use horizontal separator lines (these are the first of potentially 2 separator
		pel-erlang-use-secorpel-erlang-skel-with-		: set whether blocks use a second block horizontal separator line. : set whether generated code comments use EDoc markup.
		• pel-erlang-skel-with-		: set whether file header blocks use open source software license text controlled by [1] lice.
				But by using file and directory variables (see <u>File/Directory Variables</u>) they can also be used by tree. So by default, the user options that control the PEL tempo template take effect globally
				write the user option control block at the end of that file. If you want to control the behaviour of tree create a .dir-locals file and store the values of the relevant options variables inside that file.
		This allows you to control	the user options affecting th	ne format of the tempo templates precisely and does not affect what you actually type. ng the pel-tempo-mode) you can move to the next or previous point of interest (so called tempo
		marks) with the standard	tempo-mode keys C-c M-	-f and C-c M-b or some other keys like C-c . and C-c ,.
				an also type the template name and then hit C-c C-M-i or <f12> <f12> <f12></f12></f12></f12> . This orary buffer. This is mainly useful for templates which short names such as "if", "case", etc
+ : additional template	es	Some of the template nam	os in the title column are als	so links to the relevant Erlang language construct reference page.
: templates with				e in erlang-mode. Their global equivalent is <f11> SPC e</f11> . It is not always shown for brevity.

• Delete/Kill symbol	and the second of the second o	nd 'sp-forward-symbol ' fo	r what constitutes a symbol for the backward and forward commands respectively.
Delete symbol backward	M-f7> DEL a	(sp-backward-delete- symbol &optional ARG WORD)	Delete a symbol backward, skipping over any intervening delimiters. Deleted symbol does not go to the clipboard or kill ring. With ARG being positive number N, repeat that many times. With ARG being Negative number -N, repeat that many times in forward direction.
Delete symbol forward <m< th=""><th>M-f7> DEL s</th><th>(sp-delete-symbol &optional ARG WORD)</th><th>Delete a symbol forward, skipping over any intervening delimiters. Deleted symbol does not go to the clipboard or kill ring. With ARG being positive number N, repeat that many times. With ARG being Negative number -N, repeat that many times in backward direction.</th></m<>	M-f7> DEL s	(sp-delete-symbol &optional ARG WORD)	Delete a symbol forward, skipping over any intervening delimiters. Deleted symbol does not go to the clipboard or kill ring. With ARG being positive number N, repeat that many times. With ARG being Negative number -N, repeat that many times in backward direction.
Kill symbol backward		(sp-backward-kill- symbol &optional ARG WORD)	 Kill a symbol backward, skipping over any intervening delimiters. With ARG being positive number N, repeat that many times. With ARG being Negative number -N, repeat that many times in forward direction.
Kill symbol forward	M-f7> - s	(sp-kill-symbol &optional ARG WORD)	 Kill a symbol forward, skipping over any intervening delimiters. With ARG being positive number N, repeat that many times. With ARG being Negative number -N, repeat that many times in backward direction.
Checking Using either: • flycheck or • flymake See also: • SyntaxCheck The	Syntax checking for the Erlang programming language can be done with Emacs built-in flymake as well as with the external package flycheck. To activate either set the pel-use-erlang-syntax-check user option is set to either 'use-flycheck or 'use-flymake. By default, the syntax checker is not automatically launched. If you want to start your selected syntax checker as soon as any Erlang file is opened, add 'erlang-mode to the pel-modes-activating-syntax-check user-option. flymake is built-in Emacs. The Emacs erlang package provides erlang-flymake to use with Erlang. Flymake is built-in is installs and activates flycheck when pel-use-goflymake user option is set to 'use-flycheck. Flymake has several customizable variables, which some listed here: The following customization variables determine the exact circumstances whereupon Flymake decides to initiate a check of the buffer: flymake-start-on-flymake-mode: t to start checking when flymake-mode is started. nil to prevent check. flymake-no-changes-timeout: time to wait after last change to start checking. Default = 0.5 seconds. flymake-start-syntax-check-on-newline: t to check after insertion or removal of newline char from buffer. nil to prevent check. The following variable control navigation to next or previous error: flymake-wrap-around: If non-nil, moving to errors wraps around buffer boundaries. flymake-diagnostic-types-alist: Alist ((KEY . PROPS)*) of properties of Flymake diagnostic types. See Emacs documentation for more info. The M-n and M-p keys are mapped to flymake commands only when flymake-mode is turned on.		
	F12> !	(pel-erlang-toggle-	Toggle the selected Erlang syntax checker mode on/off.
selected syntax	f11> SPC e !	syntax-checker)	 The syntax checker activated or deactivated is either <u>flycheck</u> or <u>flymake</u>, as selected by the user-option variable <u>pel-use-erlang-syntax-check</u>. See the required settings above to activate this command and select the syntax checker.
Go to next flymake diagnostic		(flymake-goto-next- error &optional N FILTER INTERACTIVE)	Move point to the next Flymake diagnostic. With a prefix arg, skip any diagnostics with a severity less than ':warning'. Display the error message in the echo line.
Go to previous flymake diagnostic		(flymake-goto-prev- error &optional N FILTER INTERACTIVE)	Move point to the previous Flymake diagnostic. • With a prefix arg, skip any diagnostics with a severity less than ':warning'. • Display the error message in the echo line.

Description	<u>Keystroke</u>	Function	<u>Note</u>
Compiling Erlang Code		ned to compile the files. The	ce code files to .beam files located in the same directory as the source code. Detected errors are a buffer shows the location of error and the error description. The following commands are used
Compile code	• C-c C-k • <f12> M-c • <m-f12> M-c</m-f12></f12>	(erlang-compile)	Compile Erlang module in current buffer. If buffer visiting file was modified and not saved, prompts the user to save it first. Opens and *erlang* shell, in which the Erlang compile is done with a eshell c() command. The buffer lists the errors. Hitting RET on the error file/line move point to that line in the Erlang file buffer. The RET key is bound to (compile-goto-error &optional EVENT) It's also possible to use the next-error and previous error.
Display compilation output	C-c C-1	(erlang-compile-display)	Display compilation output. • Essentially opens the shell buffer where the last compilation occurred. If that shell was closed nothing can be displayed.
Move to next compile error	• C-x • M-g n • M-g M-n	(next-error &optional ARG RESET)	A prefix ARG specifies how many error messages to move; • negative means move back to previous error messages. • Just C-u as a prefix means reparse the error message buffer and start at the first error. This only shows the result of compilations; it does not report Flycheck reported errors. To use it you must compile the file first.
Move to previous compile error	• M-g p • M-g M-p	(previous-error &optional N)	Prefix arg N says how many error messages to move backwards (or forwards, if negative). This only shows the result of compilations; it does not report Flycheck reported errors. To use it you must compile the file first.
Move to next compilation or Flycheck detected error	C-c C-n	(edts-code-next-issue &optional WRAPPED)	Moves point to the next error in current buffer and prints the error. When Flymake is active, this command can be used as soon as an error is reported, even if the file was not compiled.
Move to previous compilation or Flycheck detected error	С-с С-р	(edts-code-previous- issue &optional WRAPPED)	Moves point to the next error in current buffer and prints the error. When Flymake is active, this command can be used as soon as an error is reported, even if the file was not compiled.
Development Tool	The following commands are u	used when adding Emacs Li	sp support for Erlang.
Show syntactic information	C-c C-s	(erlang-show-syntactic-information)	Show syntactic information for current line. • Display semantic Lisp data structure in the echo line. Not useful for writing Erlang.
Erlang Shell	Commands to explicitly launch comint.el library running in erla		that runs under an Emacs inferior-erlang process controlled by the comint mode from the
Open Erlang Shell	C-c C-z	(erlang-shell-display)	Display the existing Erlang shell, or start a new. Available from Erlang mode buffers only.
Start new Erlang Shell	<f11> z r e</f11>	(erlang-shell)	Start a new Erlang shell. Can be used from any buffer. • The variable 'erlang-shell-function' decides which method to use, default is to start a new Erlang host. It is possible that, in the future, a new shell on an already running host will be started.
	<f12> z</f12>		C-c C-z starts the Erlang Shell from the Erlang Mode. <f11> z r is available globally and will work as long as the erl executable is accessible.</f11>
			Under PEL this command is available only when the pel-use-erlang user option is set to t.
Work around to issues in the Erlang Shell	Redundant command echo: On some systems the Erla Set the pel-erlang Typing Ctrl-G does not oper	ng shell annoyingly echoes -shell-prevent-echo user of the Erlang JCL Comman	each typed command. If this is the case for your system, PEL provides a fix: option to t. After doing that execute pel-init or restart Emacs. d Menu: work-around: type the following instead: C-q C-g RET ork when the Erlang shell is launched inside an Emacs vterm shell (see <u>S Shells</u>).
Erlang Shell: Command History	The following commands can be used to retrieve previously issued Erlang shell commands at the shell prompt. Erlang shell command history file: The Erlang shell history controlled by Emacs is saved inside a file the is restored when opening a new shell: commands from previously opened Erlang shells are also available. Within an Emacs inferior-erlang the You can also use the Erlang shell commands to access the local shell history.		
Next shell command	M-n	(comint-next-input ARG)	Cycle forwards through Erlang shell input history.
Previous shell command	М-р	(comint-previous-input ARG)	Cycle backwards through Erlang shell input history, saving input.

<u>Description</u>	<u>Keystroke</u>	Function	<u>Note</u>
Using Man inside	Emacs provide 2 main comma		
Emacs and			nan reader available on the shell allowing navigation across man pages and opening hyperlinks.
support Erlang Man pages	The man command uses WoMan: Browse Unix Ma		Man" a complete implementation. It has some formatting limitations compared to man but it's a Windows.
See also: <u>∑ Help/Info</u>	To see Erlang man pages using the man command: On most systems the Man pages for Erlang are not available to the man utility and therefore not available for man inside Emacs. There are several ways this can be remedied: • One is to set the MANPATH environment variable to include the directory where these files are located. Then man can be used outside and inside Emacs to access Erlang's man pages. For example, the following lines can be stored inside a shell ceries to do this:		
	Emacs to access Erlang's man pages. For example the following lines can be stored inside a shell script to do this: MANPATH=/usr/local/Cellar/erlang/22.3.4/lib/erlang/man:`manpath` export MANPATH • Another way is to customize the Emacs Man-switches user option variable to something that includes the same directory. This will add the		
	 Another way is to customize the Emacs Man-switches user option variable to something that includes the same directory. This will add the cap of Emacs man to fin the Erlang's man pages without modifying the capabilities of the parent shell. For example, if we want to use the same directory as the above example we need to set the Man-switches which is normally set to nil to the following value: "-M`manpath`:/usr/local/Cellar/erlang/22.3.4/lib/erlang/man" 		
	The second alternative can be used to add other directories for the man pages of other programming languages while leaving the ability to have shells that have their own value of MANPATH. That might be very useful for someone that uses different versions of Erlang in a system and ne access to the man pages of different versions of Erlang. It becomes possible to run different shells inside Emacs with each having its own value MANPATH and therefore providing the man pages from different locations. It is also possible to place all of these directories inside the Man-symany many sability to view several pages for the same topic.		
	To only see Erlang topics in Man completion: When learning Erlang it might help to see only Erlang topics when using the man command completion. To do that, set MANPATH to the Erlang directory only. You must also ensure that a whatis file is located in the Erlang man page root directory, otherwise Emacs man completion will not See my description on how to create whatis file for local man directory.		
	EDTS (see below) support	s the ability to download and cess sections inside the mar	f Erlang used by various projects: d access man pages of several Erlang versions, tied to your Erlang projects. EDTS provides it's ne pages, allowing EDTS driven man page access to co-exist with manual man command
About Erlang	PEL supports multiple versions of Erlang and access to their man pages Inside the pel-erlang-environment group, the pel-erlang-man-parent-rootdir user-option can be set to read the man parent directory name from a environment variable. To support the ability to open the man files related to a specific version of Erlang available to the parent OS shell, set the environment variable when you select the version of Erlang available to the OS shell and set the name of the environment variable in the pel-erlang-man-parent-rootdir user-option. See the following Installing Erlang pages of the About Erlang document that describes an setting such an editing		
	 Creating whatis files Using the Erlang Mar Using Specialized OS 	n files within Emacs	
See also: <u>∑ Menus</u>	Use the following commands to You can also use the toolba		e inside Emacs. th < f10>) in the Erlang section.
Open a man page inside an Emacs buffer	• <f11> ? m • #8-M</f11>	(man MAN-ARGS)	Using man pages inside emacs is even better than using it from the shell because: • the links are active and can be followed. When the man page describes a directory or file, emacs will open the file or the directory (in direct mode) when pressing RET over the link.
See also: • <u>S Help/Info</u> • <u>S Customize</u>			 You can navigate easily between sections (n/p will move to the next/previous section) You can use any of the searches. You can use any of the options to the man command at the prompt, like the -a option to access all man pages of the same name. Then use M-n and M-p to move from one to the other page, inside the same buffer. See all keys available in mode, with <f1> m or <f11>? k m.</f11></f1> The man command prompts, using the word at point as the default. PEL key sequence to customize man: <f11> <f2> E m</f2></f11>
Open a man page	<f11> ? w</f11>	(woman &optional TOPIC	
without external man process: woman See also: • Help/Info • Customize	CIII2 ? W	RE-CACHE)	(and therefore without using the external 'man' process). That can be very useful under environments where man is not available (such as basic Windows). PEL key sequence to customize man: <f11> <f2> E w text width, use word at point, etc</f2></f11>
EDTS	EDTS - Erlang Developr	nent Tool Suite	
	The commands in the follo	wing rows require the EDTS	external package. PEL activates it when the pel-use-edts user option is set to t . If you want set pel-use-edts to start-automatically instead of t .
Erlang Project settings	EDTS is customizable through it edts customization group. With PEL you can open it, with other Erlang specific groups with <f12> <f3></f3></f12> . EDTS also uses an external .edts configuration file to store Erlang project specific settings. See EDTS: Configure your projects. This allows setting the following: project name, node-name, erlang-cookie, lib-dirs, start-command, top-path, dialyzer-plt, app-include-dirs, project-include-dirs, xref-error whitelist, xref-file-whitelist		
See also: <u>Sessions</u>	Desktop restoration often fails when edts-mode was active on session stored: unfortunately edts does not provide a desktop restore handler. ● PEL does, however provide a desktop restore handler for EDTS which detects edts-mode failures and protect the desktop restoration. ■ If EDTS has not been activated yet, the only EDTS specific key available is <f12> M-SPC to activate it. Once it's activated the other keys are available.</f12>		
Toggle EDTS mode	<f12> M-SPC</f12>	(edts-mode &optional	Turn EDTS mode on or off.
	<f11> SPC e M-SPC</f11>	ARG)	 EDTS is an easy to set up Development-environment for Erlang. EDTS also incorporates a couple of other minor-modes, currently auto-highlight-mode and auto-complete-mode. They are configured to work together with EDTS but see their respective documentation for information on how to configure their behaviour further.
EDTS/Navigation	above in the navigation section	n. The EDTS navigation fundomnosmos move across Erlang function	cross Erlang functions: ferl-goto-previous-function and ferl-goto-next-function. They are listed ctions do not support repetition prefix argument nor they support shift marking. There are other ions, and PEL support functions that perform the same and support repetition and shift marking.
EDTS/Cross References			It supports navigating in Erlang source code running in the current and remote nodes. e in erlang-mode. Their global equivalent is <f11> SPC e . It is not always shown for brevity.</f11>
Find definition of identifier at point	M	(edts-find-source- under-point)	Goto the source code that: defines the function being called at point or header file included at point. For remote calls, contacts an Erlang node to determine which file to look in, with the following algorithm: • Find the directory of the module's beam file (loading it if necessary). • Look for the source file in: • Directory where source file was originally compiled. • Todo: Same directory as the beam file • Todo: Again with /ebin/ replaced with /src/ • Todo: Again with /ebin/ replaced with /erl/ Otherwise, report that the file can't be found.

<u>Description</u>	<u>Keystroke</u>	Function	<u>Note</u>
Go back to where M was last issued	М-,	(edts-find-source- unwind)	Unwind back from uses of 'edts-navigate'-commands.
Lists caller of function at point	• C-c C-d w • <f12> w</f12>	(edts-xref-who-calls)	Pops-up a menu of all callers of the function at point.
List the callers again	• C-c C-d W • <f12> W</f12>	(edts-xref-last-who-calls)	Redo previous call to edts-who-calls.
Find a function in the current module	• C-c C-d f • <m-f12> M-f</m-f12>	(edts-find-local- function SET-MARK)	Find a function in the current module. List local functions in the mini-buffer. Support completion. Move point to selected one. With C-u prefix, push mark before moving point.
Find a module in the current project	• C-c C-d F • <m-f12> M-g</m-f12>	(edts-find-global- function)	Find a module in the current project. • List project modules in the mini-buffer. Support completion. Open the file of selected one.
EDTS/AHS Editing	in all of the buffer. The automa	atic symbol highlighting mod lts to 1.0 second.	S). and provides commands to modify the name of the highlighted name in the current function or de starts when the cursors stays on a symbol for a period longer than the value identified by the nove point away from the highlighted area.
Edit all highlighted symbols in current function	• C-c C-d e • <f12> e</f12>	(edts-ahs-edit-current- function)	Once a symbol is highlighted, use this command to start editing all instances of this symbol in the current function. • Activates ahs-edit-mode with edts-current-function range-plugin.
Edit all highlighted symbols in buffer	• C-c C-d E • <f12> E</f12>	(edts-ahs-edit-buffer)	Once a symbol is highlighted, use this command to start editing all instances of this symbol in the current buffer. • Activates ahs-edit-mode with ahs-range-whole-buffer range-plugin.
Move to the next highlighted symbol	<f12> n</f12>	(ahs-forward)	Once a symbol is highlighted, move forward to the next highlighted symbol.
Move to the previous highlighted symbol	<f12> p</f12>	(ahs-backward)	Once a symbol is highlighted, move forward to the previous highlighted symbol.
Move to the originally highlighted symbol	<f12> .</f12>	(ahs-back-to-start)	Once a symbol is highlighted, move back to the symbol that was highlighted at the start of that highlight session.
Refactor: replace region by call to function and add a new function	• C-c C-d r • <f12> r</f12>	(edts-refactor-extract- function NAME START END)	Refactor the expression(s) in the region as a function. The expressions are replaced with a call to the new function, and the function itself is placed on the kill ring for manual placement. The new function's argument list includes all variables that become free during refactoring - that is, the local variables needed from the original function. New bindings created by the refactored expressions are *not* exported back to the original function. Thus this is not a "pure" refactoring. This command requires Erlang syntax tools package to be available in the node, version 1.2 (or perhaps later.)
EDTS/Man	pages per project, so it is poss	sible to have several Erlang	projects each one with a different version of Erlang and their corresponding man pages. EDTS maintains a set of Erlang man projects each one with a different version of Erlang and their corresponding man pages.
Download, install, select Erlang Man pages	<f12> `</f12>	(edts-man-setup)	Download and install OTP man-pages that will be used by the following 2 EDTS commands.
Display help for function at point	• C-c C-d h • <f12> h</f12>	(edts-show-doc-under- point)	Find and display the man-page documentation for function under point in a tooltip.
Find and show man- page info for an Erlang module:function	• C-c C-d H • <f12> H</f12>	(edts-find-doc)	Prompts for a module, then a function. Find and show the man-page documentation for the Erlang module:function.
EDTS Code Analysis			
Compile current buffer	<f12> a c</f12>	(edts-code-compile- and-display)	Compiles current buffer on node related to that buffer's project.
Run eunit tests	• C-c C-d t • <f12> a t</f12>	(edts-code-eunit &optional COMPILATION-RESULT)	Runs eunit tests for current buffer on node related to that buffer's project.
Run dialyzer	<f12> a a</f12>	(edts-dialyzer-analyze)	Runs dialyzer for all live buffers related to current buffer either by belonging to the same project or, if current buffer does not belong to any project, being in the same directory as the current buffer's file.
EDTS/Debug			
Toggle breakpoint	• C-c C-d b • <f12> d b</f12>	(edts-debug-toggle- breakpoint)	Toggle breakpoint on current line.
List breakpoints	C-c C-d M-b • <f12> d B</f12>	(edts-debug-list- breakpoints &optional SHOW)	Show a listing of all breakpoint on all nodes registered with EDTS. If optional argument SHOW is nil or omitted, don't display process list buffer. If it is pop call 'pop-to-buffer', if it is switch call 'switch-to-buffer'.
List Erlang processes	• C-c C-d M-p • <f12> d p</f12>	(edts-debug-list- processes &optional SHOW)	Show a listing of all processes on all nodes registered with EDTS. If optional argument SHOW is nil or omitted, don't display process list buffer. If it is pop call 'pop-to-buffer', if it is switch call 'switch-to-buffer'.
Toggle interpretation state of module	• C-c C-d i • <f12> d i</f12>	(edts-debug-toggle- interpreted)	Toggle the interpretation state for module in current buffer.
List interpreted modules	• C-c C-d M-i • <f12> d I</f12>	(edts-debug-list- interpreted &optional SHOW)	Show a listing of all interpreted modules on all nodes registered with EDTS. If optional argument SHOW is nil or omitted, don't display interpreted list buffer. If it is pop call 'pop-to-buffer', if it is switch call 'switch-to-buffer'.
EDTS/Erlang Node			
Display EDTS Erlang Node Name	<f12> N</f12>	(edts-buffer-node- name)	Print the node sname of the erlang node connected to current buffer. • The node is either: • The module's project node, if current buffer is an erlang module, or • The buffer's erlang node if buffer is an edts-shell buffer. • The project-node of the buffer that was current buffer before jumping to the current buffer if the file of the current buffer is located outside any project (eg. an "externally" loaded module such as an otp-module or a module loaded by ~/.erlang).
Start an EDTS controlled Erlang Shell	<f12> x</f12>	(edts-shell &optional PWD SWITCH-TO)	Start an interactive erlang shell.
Start EDTS server	<f12> X</f12>	(edts-api-start-server)	Starts an edts server-node in a comint-buffer (if not already running).

Description

<u>Keystroke</u>

Function

<u>Note</u>

Description	<u>Keystroke</u>	Function	Note
Toggle current-line status information	s-1 T S	(Isp-ui-sideline-mode &optional ARG)	Minor mode for showing status information for current line. • Displays code status such as definition errors, etc
Toggle code action on modelling	s-1 T a	(Isp-modeline-code- actions-mode &optional ARG)	Toggle code actions on modeline.
Toggle headline breadcrumbs	s-1 T b	(Isp-headerline- breadcrumb-mode &optional ARG)	Toggle breadcrumb on headerline. • When active the list of directories are listed on the header line. In graphics mode these are buttons you can use to change directory.
Toggle hover information	s-1 T d	(Isp-ui-doc-mode &optional ARG)	Minor mode for showing hover information in child frame. When active, information about symbol at point is shown in a pop-up overlay area. In graphics mode the information has links that can be used to open web-located information. For small window the information may cover too much code, use this command to toggle in and out of view. Also note that when the point is toward the bottom of a window the information window may not show completely and you may have to scroll your window.
Toggle symbol highlighting	s-1 T h	(Isp-toggle-symbol- highlight)	Toggle symbol highlighting.
Toggle code-lens	s-1 T 1	(Isp-lens-mode &optional ARG)	Toggle code-lens overlays. • Code-lens show information like # times a specific function is referenced.
Execute code action	s-l a a	(Isp-execute-code- action INPUT0)	Execute code action ACTION. If ACTION is not set it will be selected from 'lsp-code-actions-at-point'. Request codeAction/resolve for more info if server supports.
Highlight all relevant references to symbol at point	s-1 a h	(Isp-document- highlight)	Highlight all relevant references to the symbol under point.
Click LSP lens via avy	s-1 a 1	(Isp-avy-lens)	Click lsp lens using 'avy' package. • The code lens must be active. Use s-1 T 1 to activate it if it's not active.
Apropos search for symbol/regexp	s-1 g a	(xref-find-apropos PATTERN)	Find all meaningful symbols that match PATTERN. Can be used to search symbol outside project. The argument has the same meaning as in 'apropos'. The result is shown in a *xref* buffer.
Find definitions of symbol at point	s-1 g g	(Isp-find-definition &key DISPLAY-ACTION)	Find definitions of the symbol under point.
Find implementations of symbol at point	s-l g i	(Isp-find- implementation &key DISPLAY-ACTION)	Find implementations of the symbol under point.
Find references of symbol at point	s-1 g r	(Isp-find-references &optional INCLUDE- DECLARATION &key DISPLAY-ACTION	Find references of the symbol under point. • The result is shown in a *xref* buffer.
Trigger display hover information	s-1 h g	(Isp-ui-doc-glance)	Trigger display hover information popup and hide it on next typing.
Display documentation of symbol at point in *lsp-help*	s-1 h h	(Isp-describe-thing-at- point)	Display the type signature and documentation of the thing at point. • Display help about symbol at point inside a *Isp-help* buffer. • Useful in terminal mode as you can navigate inside the buffer and used other functions to open identified URL references.
Refactor source import	s-1 r o	(Isp-organize-imports)	Perform the source.organizeImports code action, if available.
Rename symbol at point See also: Search/Replace	s-1 r r	(Isp-rename NEWNAME)	Rename the symbol (and all references to it) under point to NEWNAME. For renaming the arguments of a function, the <u>iedit mode</u> is more appropriate. It supports restricting the scope to the current function. See <u>Search/Replace</u>
Disconnect LSP	s-1 w D	(Isp-disconnect)	Disconnect the buffer from the language server.
Describe LSP session	s-1 w d	(Isp-describe-session)	Describes current 'Isp-session'. • Show available tools and the available capabilities • Shows the information inside a LspBrowser buffer.
Shut LSP workspace down	s-1 w q	(Isp-workspace- shutdown WORKSPACE)	Shut the workspace WORKSPACE and the language server associated with it
Restart LSP workspace	s-1 w r	(Isp-workspace-restart WORKSPACE)	Restart the workspace WORKSPACE and the language server associated with it
Activate LSP	s-1 w s	(Isp &optional ARG)	Entry point for the server startup. When ARG is t the lsp mode will start new language server even if there is language server which can handle current language. When ARG is nil current file will be opened in multi folder language server if there is such. When 'lsp' is called with prefix argument ask the user to select which language server to start.
Treemacs support • ∑x Treemacs	provide extra features that help	p Erlang development. Whe	respectively activated by PEL user-options pel-use-treemacs and pel-use-lsp-treemacs , en these are activated PEL provides bindings for the lsp-treemacs features. s customization group. With PEL use sf12> wwsf12> wsf12> w

<u>Description</u>	<u>Keystroke</u>	Function	<u>Note</u>
Open LSP Treemacs type hierarchy window	<f12> w t</f12>	(Isp-treemacs-type- hierarchy DIRECTION)	Show the type hierarchy for the symbol at point. • With prefix 0 show sub-types. • With prefix 1 show super-types. • With prefix 2 show both. This is not implemented for Erlang.
Rendering markup embedded in comments	The following commands are used to create images from specific markup code embedded inside Erlang source code comments. This can be useful when using these markup languages to describe UML diagrams or finite-state machines for example. You can also use Graphviz, see M Graphviz Dot		
Preview UML diagram	<f12> u</f12>	(pel-render-	Render the PlantUML markup embedded in current mode comment.
from plantUML source in current plantUML region of commented source code See also: M PlantUML	<f11> SCP e u</f11>	commented-plantuml PREFIX &optional POS)	 Use region if identified otherwise use PlantUML block at point. Uses prefix (as PREFIX) to choose where to display it: 4 (when prefixing the command with C-u) -> new window 16 (when prefixing the command with C-u C-u) -> new frame. else -> new buffer This can be used inside buffer using any major mode, when PlantUML markup is embedded inside source code comment.
	PlantUML block and issuing th	nis command.	cture with PlantUML markup, then generate the UML rendering by moving point inside the

Emacs & Erlang - References

Document	Notes
Erlang/OTP	Erlang/OTP home page. This is Erlang's official site.
Erlang versions	Erlang Versions - Version Scheme Erlang Support, Compatibility, Deprecations, and Removal
Erlang/OTP @ Github	Erlang source code
Erlang Community	Links to various topics including how to develop Erlang, learning Erlang, Community mailing lists and chats, contribution, Erlang Issue Tracker, events.
Erlang Mailing Lists	The mailing lists still exist but unfortunately seem to be used less and less.
Erlang/BEAM	Erlang was the first of one of several programming language that runs on the BEAM VM.
Good introduction presentations on Erlang	The soul of Erlang and Elixir • Saša Jurić • GOTO 2019 A very good presentation that captures the essence of why Erlang is so important. Fast pace. A must see. A great presentation to show people that may be reluctant to use the technology. The Do's and Don'ts of Error Handling • Joe Armstrong • GOTO 2018
Erlang References	
Erlang Reference Manual User's Guide	The official Erlang language reference. Lists the BIFs (Built-in functions), reserved words, and all language reference info.
A Concise Guide to Erlang	A very nice quick reference. From David Matuszek, University of Pennsylvania
Erlang Code Guidelines	
Erlang Programming Rules and Conventions	Official Ericsson AB Erlang guidelines.
Inaka's Erlang Coding Standards & Guidelines	Guideline used at Inaka, published on Github.
EDoc User's Guide	Describes how to document code.
Erlang Books	There are several printed and online Erlang books. Erlang's FAQ lists several of them. The following lists some extra ones.
Adopting Erlang	A great and recent (2019 and later) online books on Erlang Development that provides information not available in the Erlang introduction books. Describes how to install Erlang, and how to setup editing tools. A must read to setup Erlang development. This is still work in progress as of May 2020. Each page has a date time stamp.
Erlang Information Sites	
How to setup a local Erlang & Elixir dev environment on Mac from source	LambdaCat post on August 2015. Describes how to use Kerl to install Erlang. Also describes tools to install Elixir. However to get kerl on a macOS machine, using Homebrew is simpler.
about-erlang trying-erlang	These are 2 projects of mine, that I am currently building to centralize some information on Erlang. • about-erlang provides general information about Erlang, including: • Learning Erlang, a table with links to resources to learn Erlang. • Installing Erlang, describes various ways to install Erlang on macOS. • Tools for Erlang, describes tools you can use for Erlang development.
Emacs and Erlang Man files	
How to create a local whatis file	Show how to create a missing whatis file for a set of man pages.
The Erlang mode for Emacs (user guide) Erlang mode for Emacs (man page)	On the <u>erlang.org</u> site. Start here. Describes the 2 files (erlang.el and erlang-start.el) provided by the Erlang mode support, how to set them up for various operating systems. Note, however, that PEL provides the setting for you. It also provides an overview of the various features the package provides. • If found bugs in the <u>erlang man</u> page in the Edit- Moving the marker section. 1) it's the point that is moved, not the marker, 2) C-a is not an Emacs key prefix, so their key binding descriptions like C-a M-a and C-a M-e are invalid. Reported as <u>ERL-1314</u> . • There's missing information in this. I will identify later as I find out how to get the system going. One aspect to learn more is related to the various erlang-electric functions and variables. • The variable erlang-electric-commands was set to (erlang-electric-comma erlang-electric-semicolon erlang-electric-gt) at first, which does not include the erlang-electric-newline function. I tried adding erlang-electric-newline and activated it, but that made things worse: the newline was no longer automatic after a -> on a function definition line. • Another issue: inside the OS-level erlang shell, we can tab-completion a module:function string, but that does not work inside the emacs erlang shell.

Emacs tools for Erlang	
EDTS	EDTS: stands for: The Erlang Development Tool Suite. See also: • EDTS Tool Suite - Making Your Life Easier - Thomas Järvstrand presentation @ Youtube • EDTS: • configure your project • One Primary EDTS node • 1 node per open project • To setup an Erlang project: a .edts file in the project: : name "my-project" : otp-path "path/to/otp" : node-name "project-node-name" : lib-dirs '("lib" "deps")
How to install EDTS	Describes some aspects of EDTS and links that may be useful. Lists the requirements. After installing EDTS, I got several compile errors, and had to install the following other modules: - auto-complete (v1.5.1) - have to read doc and configure. And perhaps disable company mode?
Language Server Protocol	Language Server Protocol @ Wikipedia Language Server Protocol Specifications web site Language Server Protocol @ Github
LSP for Erlang	LSP support for Erlang is done using the following: The lsp-mode Emacs Lisp package The erlang ls Erlang server
company-mode ; Modular in-buffer completion framework for Emacs	
Using Tags with Erlang	
Etags with Erlang @ erlang.org	Describes how to use tags with Erlang source code and how to create the TAGS file.
Troubleshooting	This section describes how to solve some of the problems you may encounter with Erlang on Emacs.
How to prevent Erlang shell echo	On some systems the Erlang shell annoyingly echoes every command typed at the shell. The Emacs manual describes a method to prevent shells inside Emacs from echoing and it describes it as affecting Windows systems. None of the Emacs shells on my system that runs on macOS echo commands, but the Erlang shell does. And the described fix works. PEL activates the fix if the pel-erlang-shell-prevent-echo is set to t. To activate after setting it: execute pel-init or restart Emacs.
