Navigation

Move Operation	<u>Keystroke</u>	Function	<u>Note</u>	
Navigation Commands	Emacs provides a large amount of commands for moving point (Emacs name for cursor) inside a buffer. Several are built in Emacs. Others are provided by external packages or by PEL itself. This table list the main generic commands for navigation. PEL provides access and activation of the following external packages that provide extra navigation commands and modes: The avy external package activated when the pel-use-avy user option is set to t. This page lists the basic, globally available navigation commands. Also see the programming language specific sheets for more information on specialized navigation provided by these modes and the tools they support. These other pages will refer to this one and might also refer to pages describing special minor modes and tools that enhance Emacs navigation capabilities.			
∑ Customize PEL navigation control	<f11> <f2> P n 1</f2></f11>	(pel-cfg-pkg-navigation &optional OTHER-WINDOW)	Customize PEL navigation tools support. • If OTHER-WINDOW is non-nil (use C-u), display in another window.	
∑ Customize Emacs navigation control	<f11> <f2> P n 2</f2></f11>	(pel-cfg-pkg-navigation &optional OTHER-WINDOW)	Customize Emacs navigation tools support: <u>avy</u> . • If OTHER-WINDOW is non-nil (use C - u), display in another window.	
Shift-Selection	If you press and hold the shift key while typing a movement command, it sets the mark before moving point (Emacs name for cursor) so that the region extends from the original point to its new position. This <u>Shift-Selection</u> is also called "Shift-Marking" in this document. It is available for several commands but not all. Also when running Emacs in Terminal mode, less commands are able to use it. The ability to perform "Shift-Marking" is identified in the description of the commands below.			
Move Point	The following sub-section	ns describe how to navigate acro	oss various types of textual and syntactical entities.	
• by <u>character</u>	Note: All commands in the reverse direction.	e following group support the bi	directional context, so when editing right to left text these commands may move the point in the	
right/next char	C-f	(forward-char &optional N)	Move point N characters forward (backward if N is negative). On reaching end or beginning of buffer, stop and signal error. Interactively, N is the numeric prefix argument. If N is omitted or nil, move point 1 character forward. Depending on the bidirectional context, the movement may be to the right or to the left on the screen. This is in contrast with <right>. Shift marking is available in graphics mode, not in terminal mode.</right>	
right/next char	<right></right>	(right-char &optional N)	Move point N characters to the right (to the left if N is negative). On reaching beginning or end of buffer, stop and signal error. Shift marking works with this command.	
left/previous char	С-Б	(backward-char &optional N)	 Move point N characters backward (forward if N is negative). On attempt to pass beginning or end of buffer, stop and signal error. Interactively, N is the numeric prefix argument. If N is omitted or nil, move point 1 character backward. Depending on the bidirectional context, the movement may be to the right or to the left on the screen. This is in contrast with <left>.</left> Shift marking is available in graphics mode, not in terminal mode. 	
left/previous char	<left></left>	(left-char &optional N)	Move point N characters to the left (to the right if N is negative). On reaching beginning or end of buffer, stop and signal error. ➤ Shift marking works with this command.	
Go to a specific char position	М-д с	(goto-char POSITION)	Enter a character position, a decimal value identifying the index into the continuous set of characters in the buffer. Shift marking does not work with this command.	
by character using <u>avy</u>	When using these commands, type the character(s) where you want to move; avy highlights the target locations with another character: type that character to move to the location. The location can be inside any window. This provides a very efficient way of moving the point. Shift selection is not supported but you can mark (see <u>Narking</u>) before moving to create a marked region. These commands require the avy external package activated when the pel-use-avy user option is set to t.			
Jump to visible char	• C-: • M-G	(avy-goto-char CHAR &optional ARG)	Jump to the currently visible CHAR. • The window scope is determined by 'avy-all-windows' (ARG negates it). Shift marking does not work with this command.	
Jump to visible 2 chars	• C-'	(avy-goto-char-2 CHAR &optional ARG)	Jump to the currently visible CHAR1 followed by CHAR2. • The window scope is determined by 'avy-all-windows'. • When ARG is non-nil, do the opposite of 'avy-all-windows'. • BEG and END narrow the scope where candidates are searched. First marking does not work with this command.	
• by <u>line</u>	 In terminal mode C-p and C-n cannot be used in conjunction with Shift for marking. The <up> and <down> cursor can be used with Shift for marking.</down></up> When moving up or down, if there is no character in the target line exactly over the current column, the cursor is positioned after the character in that line which spans this column, or at the end of the line if it is not long enough. 			
Previous line	• C-p • <up></up>	(previous-line &optional ARG TRY-VSCROLL)	Move cursor vertically up ARG lines. • C−p : Shift marking is available in graphics mode, not in terminal mode. • <up> • <up> • Shift marking works with this command.</up></up>	
Next line	• C-n • <down></down>	(next-line &optional ARG TRY-VSCROLL)	Move cursor vertically down ARG lines. • C-n : ► Shift marking is available in graphics mode, not in terminal mode. • <down> : ► Shift marking works with this command.</down>	
Go to a specific line in current buffer	• M-g g • M-g M-g • %-1	(goto-line LINE &optional BUFFER)	Go to LINE, counting from line 1 at beginning of buffer. • If called interactively, a numeric prefix argument specifies LINE; without a numeric prefix argument, read LINE from the minibuffer. • If optional argument BUFFER is non-nil, switch to that buffer and move to line LINE there. If called interactively with C-u as argument, BUFFER is the most recently selected other buffer. • Prior to moving point, this function sets the mark (without activating it), unless Transient Mark mode is enabled and the mark is already active. • Shift marking does not work with this command.	
Goto window line using avy • potentially in other window	M-g f	(avy-goto-line &optional ARG)	Jump to line start in current (or all visible if 'avy-all-windows' is t) window. Type highlighted key to move point. More control available with prefix argument: • ARG=1: you can also type a number to cancel and use 'goto-line' for this typed number. • ARG=4: negate the window scope determined by 'avy-all-windows'. • ARG=any other number: use 'goto-line' to move point to this line number. • Shift marking does not work with this command. • Requires the avy external package activated when the pel-use-avy user option is set to t.	
• To column	The following command r	move point to a specified column	n. It does not provide Shift-marking.	
Go to a specific column	M-g <tab></tab>	(move-to-column COLUMN & optional FORCE)	Prompts for a column number (or it can be entered as a command prefix). • Move point to column COLUMN in the current line. • The column of a character is calculated by adding together the widths as displayed of the previous characters in the line. • This function ignores line-continuation; there is no upper limit on the column number a character can have and horizontal scrolling has no effect. • If specified column is within a character, point goes after that character. • If it's past end of line, point goes to end of line. • If a region is marked and point is at one end, modifies the region.	

Move Operation	<u>Keystroke</u>	Function	<u>Note</u>	
Set Goal Column	The goal column identifies	a target for point when moving	to a line. The goal column is stored in the variable 'goal-column'. This is a buffer-local setting.	
Set/reset Goal Column	С-х С-п	(set-goal-column ARG)	Set the current horizontal position as a goal for C-p and C-p . Those commands will move to this position in the line moved to rather than trying to keep the same horizontal position. • Without argument: activate the goal column and set it to the current column. • With non nil argument (example: C-u): disable the goal column. • When the goal column is active, it is shown as G on the ruler (when the ruler-mode is active.) Execute ruler-mode (<f11> b -) to activate the ruler to see if the goal column is active. • This command might be disabled at first, so in that case the first time you use it Emacs might prompt for activating this command. See enable-command in the Emacs Lisp table.</f11>	
• into line	The following commands	move point within the current lin	ne.	
Beginning of line ★ PEL Enhanced Key ★	C-a	Text: (pel-beginning-of- line ARG) Org-Mode: (org- beginning-of-line &optional N)	Move point to beginning of current line as displayed. If point is already at the beginning of the line, move to the fist non-whitespace character (using back-to-indentation). • (If there's an image in the line, this disregards newlines which are part of the text that the image rests on.) • With argument ARG not nil or 1, move forward ARG - 1 lines first. • If point reaches the beginning or end of buffer, it stops there. (But if the buffer doesn't end in a newline, it stops at the beginning of the last line.) ⇒ Shift marking is available in graphics mode, not in terminal mode. In Org-mode: Go to the beginning of the current visible line. • If this is a headline, and 'org-special-ctrl-a/e' is set, ignore tags on the first attempt, and only move to after the tags when the cursor is already beyond the end of the headline.	
End of line	С-е	1. Text: (pel-end-of-line	Move point to end of current line as displayed. If point is already at the end of the line, move point	
★ PEL Enhanced Key ★		ARG) 2. Org-Mode: (org-end-of-line &optional N)	to the first trailing space character if there is any. With argument ARG not nil or 1, move forward ARG - 1 lines first. If point reaches the beginning or end of buffer, it stops there. Shift marking is available in graphics mode, not in terminal mode. In Org-mode: Go to the end of the line, but before ellipsis, if any. If this is a headline, and 'org-special-ctrl-a/e' is set, ignore tags on the first attempt, and only move to after the tags when the cursor is already beyond the end of the headline.	
First non-whitespace	M-m	(back-to-indentation)	Move point to the first non-whitespace character on this line. Shift marking works with this command.	
• by <u>word</u>			variables that can be modified and is controlled by Emacs syntax table. See the subword-mode	
word forward	and superword-mode to cM-f	(forward-word &optional	Move point forward ARG words (backward if ARG is negative).	
word forward	• M- <right></right>	ARG)	 If ARG is omitted or nil, move point forward one word. Supports superword-mode and subword-mode. Shift marking works with this command (both keys). In this moves point right after the end of the word. If you want to move to the first letter of next word use M-n. 	
Beginning of next word	M-n	(pel-forward-word-start)	Move point forward to beginning of next word. • Supports superword-mode but not the subword-mode. ➡Shift marking works with this command. ➡On Qwerty, Qwerztz and Azerty keyboards the 'b' and 'n' letters are side by side. ⚠ This key binding differs in other buffers. • In Info buffers, M-n is mapped to clone-buffer. • Inside shell buffers M-n is mapped to comint-next-input. • For the moment PEL does not change this but might (via a PEL user option in the future) since it's such a useful key.	
word backward	• M-b • M- <left></left>	(backward-word &optional N)	Move backward until encountering the beginning of a word. With argument ARG, do this that many times. • Supports superword-mode and subword-mode. ⇒ Shift marking works with this command (both keys).	
beginning of next token	C- <right></right>	(pel-forward-token-start &optional N)	 Move to the beginning of next word/symbol. It handles characters that may be part of symbol in the current major mode (like '_' in C), and jumps over them but stops at whitespace and operators. Supports numerical argument for repetition. Negative argument reverses the movement direction. Shift marking works with this command. Useful when the superword-mode is not activated: allows jumping to next symbol while the word commands stop at each word separator character. 	
beginning of previous token	C- <left></left>	(pel-backward-token-start &optional N)	 Move to the beginning of previous word/symbol. It handles characters that may be part of symbol in the current major mode (like '_' in C), and jumps over them but stops at whitespace and operators. Supports numerical argument for repetition. Negative argument reverses the movement direction. Shift marking works with this command. Useful when the superword-mode is not activated: allows jumping to previous symbol while the word commands stop at each word separator character. 	
Goto word using 1 letter with avy • potentially in other window	M-g w	(avy-goto-word-1 CHAR &optional ARG BEG END SYMBOL)	Jump to the currently visible CHAR at a word start. Type first letter of target word, then highlighted key(s). • The window scope is determined by 'avy-all-windows'. • When ARG is non-nil, do the opposite of 'avy-all-windows'. • Shift marking does not work with this command. • Requires the avy external package activated when the pel-use-avy user option is set to t.	
Goto word with avy • potentially in other window	M-g е	(avy-goto-word-0 ARG &optional BEG END)	 Jump to a word start. Highlights each word with letters to select to jump. No need to type a key first. The window scope is determined by 'avy-all-windows'. When ARG is non-nil, do the opposite of 'avy-all-windows' Shift marking does not work with this command. Requires the <u>avy external package</u> ∠ activated when the pel-use-avy user option is set to t. 	
by syntactic elements	Moving by syntactic elements, regardless of the word mode.			
			yntax handling of various Emacs major modes.	
Move point forward to next syntactic change	• <f11> M-<right> • <f11> M-f</f11></right></f11>	(pel-forward- syntaxchange-start)	Move point forward: stop at beginning of character syntax change.	
Move point backward to previous syntactic change	• <f11> M-<left> • <f11> M-b</f11></left></f11>	(pel-backward- syntaxchange-start)	Move point backward: stop at beginning of character syntax change.	

Move Operation	<u>Keystroke</u>	Function	<u>Note</u>
• by blocks		ackets: (),[],{},<>,"", ''. Blocks uing languages that support blocks.	ising parentheses correspond to Lisp S-Expressions (sexp). This works in Lisp-like programming sk syntax.
block backward	• C-M-b • C-M- <left> • C-[C-b • Esc C-b • Esc C-<left></left></left>	(backward-sexp &optional ARG)	Move backward across one balanced expression (sexp). • With ARG, do it that many times. Negative arg -N means move forward across N balanced expressions. This command assumes point is not in a string or comment. • C-M-b : ► Shift marking is available in graphics mode, not in terminal mode. • C-M-<1eft> : ► Shift marking works with this command. • ⚠ With PEL: if you want to use Esc C-<1eft> binding you must ensure that pel-windmove-on-esc-cursor user option is set to nil. • C-M-<1eft> does not work on Windows, but H-<1eft> works. ■ Several Linux distros map C-M-<1eft> to desktop workspace operation. In that case you can either use another key binding or change Linux key binding in Systems->settings->keyboard->shortcuts to prevent it from using that key sequence.
block forward	• C-M-f • C-M- <right> • C-[C-f • Esc C-f • Esc C-<right></right></right>	(forward-sexp & optional ARG)	Move forward across one balanced expression (sexp). • With ARG, do it that many times. Negative arg -N means move backward across N balanced expressions. This command assumes point is not in a string or comment. • C-M-f : Shift marking is available in graphics mode, not in terminal mode. • C-M- <right> : Shift marking works with this command. • With PEL: if you want to use Esc C-<right> binding you must ensure that pel-windmove-on-esc-cursor user option is set to nil. • C-M-<right> does not work on Windows, but H-<right> does. • Several Linux distros map C-M-<right> to desktop workspace operation. In that case you can either use another key binding or change Linux key binding in Systems->settings->keyboard->shortcuts to prevent it from using that key sequence.</right></right></right></right></right>
Up/inside sexp hierarchy	• C-M-u • C-M- <up> • C-[C-u • Esc C-u • Esc C-<up></up></up>	(backward-up-list &optional ARG ESCAPE-STRINGS NO- SYNTAX-CROSSING)	Move backward out of one level of parentheses. • This command will also work on other parentheses-like expressions defined by the current language mode. With ARG, do this that many times. • A negative argument means move forward but still to a less deep spot. • ⚠ With PEL: if you want to use Esc C- <up> binding you must ensure that pel-windmove-on-esc-cursor user option is set to nil. • C-M-u : Shift marking is available in graphics mode, not in terminal mode. • C-M-<up> : Shift marking works with this command.</up></up>
Down/inside sexp/block	• C-M-d • C-M- <down> • C-[C-d • Esc C-d • Esc C-d</down>	(down-list &optional ARG)	Move forward down one level of parentheses. This command will also work on other parentheses-like expressions defined by the current language mode. With ARG, do this that many times. A negative argument means move backward but still go down a level. This command assumes point is not in a string or comment. Mith PEL: if you want to use Esc C- <down> binding you must ensure that pelwindmove-on-esc-cursor user option is set to nil. C-M-d: Shift marking is available in graphics mode, not in terminal mode. C-M-<down> : Shift marking works with this command.</down></down>
Up/right sexp/block	C-M-]	(up-list &optional ARG ESCAPE-STRINGS NO- SYNTAX-CROSSING)	Move forward out of one level of parentheses. This command will also work on other parentheses-like expressions defined by the current language mode. With ARG, do this that many times. A negative argument means move backward but still to a less deep spot. If ESCAPE-STRINGS is non-nil (as it is interactively), move out of enclosing strings as well. If NO-SYNTAX-CROSSING is non-nil (as it is interactively), prefer to break out of any enclosing string instead of moving to the start of a list broken across multiple strings. On error, location of point is unspecified.
Backward block/list	• C-M-p • C-[C-p • Esc C-p	(backward-list &optional ARG)	Move backward across one balanced group of parentheses. This command will also work on other parentheses-like expressions defined by the current language mode. With ARG, do it that many times. Negative arg -N means move forward across N groups of parentheses. This command assumes point is not in a string or comment. C-M-p: Shift marking is available in graphics mode, not in terminal mode.
Forward block/list	• C-M-n • C-[C-n • Esc C-n	(forward-list &optional ARG)	Move forward across one balanced group of parentheses. This command will also work on other parentheses-like expressions defined by the current language mode. With ARG, do it that many times. Negative arg -N means move backward across N groups of parentheses. This command assumes point is not in a string or comment. C-M-n : Shift marking is available in graphics mode, not in terminal mode.
• to symbol definition	The following command can be used to move point to any quickly selected a symbol definition, in any major mode supported by imenu. • Most major modes for programming and markup languages support imenu. PEL adds extra support for some modes. • Note that it is also possible to use the Speedbar (which also uses the symbols detected by imenu)		
Move to imenu detected symbol definition using Ido completion ★★ See also: <u>Menus</u>	• M-g h • M-g M-h	(pel-goto-symbol &optional SYMBOL-LIST)	Prompt using Ido for imenu symbol and move point to it. • Refresh imenu and jump to a place in the buffer using Ido. • Supports all Ido flex and tab completion. • This is a very quick way to select any function definition, structure, type, symbol definition and jump to it. Type tab to open a completion buffer to list all symbols that match your entry (or all symbols if you type tag with an empty entry). ■ On Qwerty , Qwerztz and Azerty keyboards the 'g' and 'h' letters are side by side, making
• by <u>defun</u>	this easy to type on these keyboards. The commands move point by function definitions. In elisp code that's defun, defvar, etc, but it also works in other modes, as the same keys are bounded to different commands. The <f6> cursor key mappings use <up> and <down> to move to the beginning of the defun, and <left> and <right> to the end of the defun. In this context the word defun corresponds to the concept of function, method, procedure, section, used for the current buffer. These commands work well when editing Lisp-like programming languages. The first two commands will skip nested functions at a level nested relative to the current level (and that can be considered a nice feature) The extra commands provided by PEL are based on the first 2 commands and inherit these limitations: The pel-beginning-of-next-defun works well in most cases but has problems handling some C++ template code. The pel-end-of-previous-defun is even more affected by the limitations when used to move inside some nested code. Obviously a better mechanism is required to navigate easily through the functions definitions in source code files in presence of various nesting scenarios.</right></left></down></up></f6>		
Backward to beginning of defun	• C-M-a • C-M- <home> • <f6> p • <f6> <up> • C-[C-a • Esc C-a</up></f6></f6></home>	(beginning-of-defun &optional ARG)	Move backward to the beginning of a defun. • With ARG, do it that many times. Negative ARG means move forward to the ARGth following beginning of defun. ► Shift marking is available in graphics mode, not in terminal mode (for C-M-a and C-M- <home>). However <f6> p and <f6> <up> handle Shift-marking fine in terminal mode. ↑ This command moves to the beginning go the next function or of the same nesting level of the current location. It skips the functions and methods that are more deeply nested.</up></f6></f6></home>

Action and section is started east. - Color - Company - Color	Move Operation	<u>Keystroke</u>	Function	Note

To end of line, window, buffer		A Because the behaviour of the key depends on the original position avoid using this key inside keyboard macros when you cannot guarantee the position			
buffer	To end of line, window,	-			
 ★ PEL Enhanced Key ★ like IELM use fields on prompt lines. If the buffer is narrowed, this command uses the end of the accessible part of the buffer. Push mark at previous position, unless either a C-u prefix is supplied, or Transient Mark mode is enabled and the mark is active. Scrolls other window when PEL window scroll mode is active. See Scrolling. Shift marking is available in graphics mode, not in terminal mode. 	buffer			• → end of field (if any) → end of line → end of window → end of buffer	
 If the buffer is narrowed, this command uses the end of the accessible part of the buffer. Push mark at previous position, unless either a C-u prefix is supplied, or Transient Mark mode is enabled and the mark is active. Scrolls other window when PEL window scroll mode is active. See ∑ Scrolling. Shift marking is available in graphics mode, not in terminal mode. 	★ PEL Enhanced Key ◆			of at the end last window line, or 4 times if there is a field in the line after the point's position. REPL	
Scrolls other window when PEL window scroll mode is active. See <u>∑ Scrolling</u> . Shift marking is available in graphics mode, not in terminal mode.	, Emidilood Rey X	If the buffer is narrowed, this command uses the end of the accessible part of the buffer.			
		 Scrolls other window when PEL window scroll mode is active. See ∑ Scrolling. Shift marking is available in graphics mode, not in terminal mode. On macOS laptops, the <end> key is not available; use Fn <right> instead.</right></end> 			
A Because the behaviour of the key depends on the original position avoid using this key inside keyboard macros when you cannot guarantee the position when the keyboard macro is invoked. Use C-e instead inside keyboard macros when you want to move point to the end of a line.					

Move Operation	<u>Keystroke</u>	Function	<u>Note</u>
To beginning of buffer	M-<	(beginning-of-buffer &optional ARG)	 Move point to the beginning of the buffer. With numeric arg N, put point N/10 of the way from the beginning. If the buffer is narrowed, this command uses the beginning of the accessible part of the buffer. Push mark at previous position, unless either a C-u prefix is supplied, or Transient Mark mode is enabled and the mark is active. Shift marking does not work with this key.
To end of buffer	M->	(end-of-buffer &optional ARG)	Move point to the end of the buffer. • With numeric arg N, put point N/10 of the way from the end. • If the buffer is narrowed, this command uses the end of the accessible part of the buffer. Shift marking does not work with this key.
To left line center, top, bottom	M-r	(move-to-window-line-top- bottom &optional ARG)	Position point relative to window. By default moves to beginning of line at: center, top, bottom of window in successive calls. Arguments: • A negative argument reverses the order. • A numeric argument identifies a line number. • Number 0 identifies the first line in window. • A Negative 0 identifies the last line in window. Shift marking does not work with this key.
• in buffer of other windows	The following 2 command	s do not move point in the curre	ent buffer, they move it in the buffer showing in the other window.
To beginning of buffer in other window	• Esc <home> • <m-home></m-home></home>	(beginning-of-buffer-other- window ARG)	Move point to the beginning of the buffer in the other window. • Leave mark at previous position. • With arg N, put point N/10 of the way from the true beginning.
To end of buffer in other window	• Esc <end> • <m-end></m-end></end>	(end-of-buffer-other- window ARG)	Move point to the end of the buffer in the other window. • Leave mark at previous position. • With arg N, put point N/10 of the way from the true end.
Goto match/ Compilation Error	A match is the result of a	orevious operation like: grep sea	arch result, compilation errors, etc
Jump to next match	• C-x • M-g n • M-g M-n	(next-error &optional ARG RESET)	A prefix ARG specifies how many error messages to move; negative means move back to previous error messages. Just C-u as a prefix means reparse the error message buffer and start at the first error.
Jump to previous match	• M-g p • M-g M-p	(previous-error &optional N)	Prefix arg N says how many error messages to move backwards (or forwards, if negative).
