in the region. Only waitable for some programming languages, builting and the programming languages. The programming languages are progra		M-;	(comment-dwim ARG)	If the region is active, comment or uncomment the region instead.
The numeric prefix ARS Coan specify a number of chase to remove the temperature of the comment of chase to remove the temperature of the comment of the comm	in the region. Only available for some programming languages, including:	C-c C-c	(comment-region BEG END &optional ARG)	With just C-u prefix arg, uncomment each line in region BEG END. Numeric prefix ARG means use ARG comment characters. If ARG is negative, delete that many comment characters instead. The strings used as comment starts are built from 'comment-start' and 'comment-padding'; the strings used as comment ends are built from 'comment-end' and 'comment-padding'. By default, the 'comment-start' markers are inserted at the current indentation of the region, and comments are terminated on each line (even for syntaxes in which newline does not end the comment and blank lines do not get comments). This can be changed with 'comment-style'. If you try this when no region is marked and the /* */ style comments is active, the comment ends on the next space, which is probably not what you
Infe Comment the region as a box C11> ; 1 Comment-box REG END & Optional ARCs Comment the marked region in a comment box.	Uncomment a region	<f11> ; u</f11>	(uncomment-region BEG END &optional ARG)	The numeric prefix ARG can specify a number of chars to remove from the comment delimiter. Sometimes the comment-dwim, shown above, does not uncomment a region, it adds another layer of comment. In that case try this command
Comment the region as a box Kill somment on surrent fine 411> ; 1 Comment-kill ARG) 411> ; 2 Comment-kill ARG) Kill somment on current fine 411> ; 3 Comment the marked region in a comment box. Kill somment on contract to on the line (whether it is at the beginning of the late or date of comment in the late of the store in the late of the late			(comment-line N)	line).

Action	Key binding	Command	Notes		
Show (or hide) comments in buffer or marked region	<f11> ; :</f11>	(hide/show-comments &optional HIDE/SHOW START END)	Hide or show comments in buffer or active region. Hide if no argument. To show, use any prefix argument (any of the C-u, M, M-0 to M-9 will do). If a region is active the command applies to the active region, otherwise it applies to the entire or narrowed buffer. Uses 'save-excursion', restoring point. Option 'show-invisible-comments-shows-all': If non-nil then using this command to show invisible text shows *ALL* such text, regardless of how it was hidden. IOW, it does not just show invisible text that you previously hid using this command. If nil (the default value) then using this command to show invisible text makes visible only such text that was previously hidden by this command. (More precisely, it makes visible only text whose 'invisible' property has value 'hide-comment'.)		
See all comment control variables		ment- <tab><tab> ment- <tab><tab></tab></tab></tab></tab>	Lists all variables that have a name that starts with the word "comment-". See the Help table for more information on getting help from within Emacs.		
Insert Commented Lines	The following commands help insert commented lines or just underlines the current line of text using the character corresponding to one of the adornment level used for reStructuredText sections. The strings are commented according to the major mode of the current buffer. If the buffer has no identified comment strings, the command prompts for them the first time it is used in that type of buffer. The following commands are also listed in the <u>N Inserting Text</u> table.				
Insert commented line		(pel-insert-line &optional LINELEN)	Insert a (commented) line before/at current line. • If point is at the beginning of the line insert it there.		
See also: <u>Naserting Text</u>	• <f6> 1</f6>		 If point is in the middle of a line, move point at beginning of line before inserting it. The number of dash characters of the line is specified by LINELEN: If LINELEN is not specified the buffer's fill-column value is used. fill-column is customizable and can be used as a file or directory variable. 		
Comment-underline current line with level 1 adornment	<f11> _ 1</f11>	(pel-commented-adorn-1)	Insert a commented level-1 reST line adornment at point.		
Comment-underline current line with level 2 adornment	<f11> _ 2</f11>	(pel-commented-adorn-2)	Insert a commented level-2 reST line adornment at point.		
Comment-underline current line with level 3 adornment	<f11> _ 3</f11>	(pel-commented-adorn-3)	Insert a commented level-3 reST line adornment at point.		
Comment-underline current line with level 4 adornment	<f11> _ 4</f11>	(pel-commented-adorn-4)	Insert a commented level-4 reST line adornment at point.		
Comment-underline current line with level 5 adornment	<f11> _ 5</f11>	(pel-commented-adorn-5)	Insert a commented level-5 reST line adornment at point.		
Comment-underline current line with level 6 adornment	<f11> _ 6</f11>	(pel-commented-adorn-6)	Insert a commented level-6 reST line adornment at point.		
Comment-underline current line with level 7 adornment	<f11> _ 7</f11>	(pel-commented-adorn-7)	Insert a commented level-7 reST line adornment at point.		
Comment-underline current line with level 8 adornment	<f11> _ 8</f11>	(pel-commented-adorn-8)	Insert a commented level-8 reST line adornment at point.		
Comment-underline current line with level 9 adornment	<f11> _ 9</f11>	(pel-commented-adorn-9)	Insert a commented level-9 reST line adornment at point.		
Comment-underline current line with level 10 adornment	<f11> _ 0</f11>	(pel-commented-adorn-10)	Insert a commented level-10 reST line adornment at point.
