Consider DPI 66.  Open bile DPI 66.  See also III. ** Let 1 1  Open bile DPI 66.  ** FEL Bilanced Key ★  ** **  **  **  **  **  **  **  **  *		<ul> <li>word is upper case and all the other letters are lower case.</li> <li>The main commands operate on words a concept that Emacs control via its syntax tables. What constitutes a word may be modified by changing the text mode, using the <u>superword-mode</u> or <u>the subword-mode</u>. The commands also operate on the letter where point (the cursor) is located. You need to position point at the beginning of the word to apply the conversion to all letters of the word.</li> <li>You can apply the word-related commands to several words, before and after point, using <u>command prefixes</u>.</li> </ul>				
Contract Def Received Contract Contra		The PEL package provides more functionality with less key bindings. Plain Emacs uses M-1, C-x C-1, M-u, C-x C-u, and M-c for the case conversion operations. The PEL package uses only M-c, M-C and M-T key bindings which operate on the current word like the original commands, but also operate on the region if it is visible. They also operate on the complete word at point, regardless of point's position within the word if a 0 numerical argument is specified. The M-c and M-C commands capitalize word(s) when you use them to convert to the same case of the "criteria" character(s). This way if text is in lower case, you can capitalize each word using M-c and if text is in uppercase you can capitalize the word(s) with M-C. You can then perform all conversions with M-c and M-C, no other key is really required.  Note that M-T and M-C require the use of the Shift key. It's OK since the original commands break the region marking done with Shift pressed during navigation anyway. PEL frees the unused M-1, M-u, C-x C-1 and C-x C-u for other bindings.
