| <b>Shift Select Control</b><br>See: <a href="#">shift selection</a><br>See: <a href="#">org-support-shift-select</a> docstring (use <b>&lt;f1&gt; o</b> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | In most major modes, Emacs supports text selection by holding the Shift key down while moving point; this feature is called <a href="#">shift selection</a> . By default, shift selection is not available in org-mode; in org-mode the shift cursor keys are used to control the bullet state, titles and timestamps.<br>👉 However, by you can customize <b>org-support-shift-select</b> to re-activate shift-selection completely (set it to <b>always</b> ) or partially (set it to <b>t</b> ) which activates shift-selection when the cursor is not in special context, and bullet cycling will only occur when point is exactly over the bullet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                         |

| <b>Lighter</b> := <a href="#">ℰ(l)</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Only affects the current buffer. Electric Pair mode is a global minor mode. When enabled, typing an open parenthesis automatically inserts the corresponding closing parenthesis, and vice versa. (Likewise for brackets, etc.). If the region is active, the parentheses (brackets, etc.) are inserted around the region instead.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                         |

This method has the disadvantage, that the previous location will be folded, which may not be what you want.</li> <li>This command works around this by showing a copy of the current buffer in an indirect buffer, in overview mode. You can dive into the tree in that copy, use 'org-occur' and incremental search to find a location. When pressing RET or 'Q', the command returns to the original buffer in which the visibility is still unchanged. After RET it will also jump to the location selected in the indirect buffer and expose the headline hierarchy above.</li> </ul> |
| Edit Structure of document                                                                                | Modify the <b>outline</b> structure of the Org document by issuing the following commands <b>on heading lines</b> . <div>  With PEL, <b>M-&lt;up&gt;</b> and <b>M-&lt;down&gt;</b> are normally bound to <b>PEL scroll commands</b>, but not in org-mode because they are bound to org-mode commands. <ul style="list-style-type: none"> <li>To scroll up/down in org-mode: use the number keypad key 3 and 9 of the <b>number keypad not num-locked</b>, or when using <b>hydra</b> external package use the <b>&lt;f7&gt;</b>   prefix with <b>&lt;up&gt;</b> and <b>&lt;down&gt;</b> keys. For more info see: <b>☞ Scrolling</b>.</li> </ul> </div> |                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

With the default settings, no level adjustment takes place, but the yanked tree is folded unless doing so would swallow text previously visible. Any prefix argument forces a normal yank: a good way to force a normal yank is <b>C-u C-y</b>.</p> <ul style="list-style-type: none"> <li>If you use yank-pop after a yank, it yanks previous kill items plainly, without adjustment and folding.</li> </ul> Look at the current kill and check if is a single subtree, or a series of subtrees. If it passes the test, and if the cursor is at the beginning of a line or after the stars of a currently empty headline, then the yank is handled specially according to the value of the following user-option variables: <p><b>org-yank-folded-subtrees:</b><br/>By default, this variable is non-nil, which results in subtree(s) being folded after insertion, except if doing so would swallow text after the yanked text.</p> <p><b>org-yank-adjusted-subtrees:</b><br/>When non-nil (the default value is nil), the subtree will be promoted or demoted in order to fit into the local outline tree structure, which means that the level will be adjusted so that it becomes the smaller one of the two "visible" surrounding headings.</p> |
| Clone sub-tree                                                                                                                                                          | <b>C-c C-x c</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | (org-clone-subtree-with-time-shift N &optional SHIFT) | Clone a subtree by making a number of sibling copies of it. Prompts for the number of copies to make; you can also specify whether any timestamps in the entry should be shifted. This can be useful, for example, to create a number of tasks related to a series of lectures to prepare. For more details, see the docstring of the command org-clone-subtree-with-time-shift                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Prompts for action: <ul style="list-style-type: none"><li>The prefix arg is passed through to the command if possible.</li></ul>                                                                                                                                                                                     |
| Accepts the following:                                                                      | <div><div>p</div><div>\$</div><div>A</div><div>t</div><div>+</div><div>-</div><div>s</div><div>d</div><div>r</div><div>S</div><div>f</div></div> <div>           Toggle persistent marks.<br/>           Archive all selected entries.<br/>           Archive entries by moving them to their respective archive siblings.<br/>           Change TODO state.<br/>           This prompts for a single TODO keyword and changes the state of all selected entries, bypassing blocking and suppressing logging notes—but not timestamps.<br/>           Add a tag to all selected entries.<br/>           Remove a tag from all selected entries.<br/>           Schedule all items to a new date.<br/>           To shift existing schedule dates by a fixed number of days, use something starting with double plus at the prompt, for example ‘++8d’ or ‘++2w’.<br/>           Set deadline to a specific date.<br/>           Prompt for a single refile target and move all entries. The entries are no longer in the agenda; refresh (g) to bring them back.<br/>           Reschedule randomly into the coming N days. N is prompted for. With a prefix argument (C-u B S), scatter only across weekdays.<br/>           Apply a function to marked entries. For example, the function below sets the ‘CATEGORY’ property of the entries to ‘web’.</div>                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                              |
| Using Column view in the Agenda                                                             | Column view (see Column View) is normally used to view and edit properties embedded in the hierarchical structure of an Org file. It can be quite useful to use column view also from the agenda, where entries are collected by certain criteria.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                              |

Selects file format from file extension: plain text (.txt),HTML (.html or .htm), PDF (.pdf) or Postscript (.ps) is produced. If the extension is .ics, translate visible agenda into iCalendar format. If the extension is .org, collect all subtrees corresponding to the agenda entries and add them in an .org file. |
