| <b>Shift Select Control</b><br>See: <a href="#">shift selection</a><br>See: <a href="#">org-support-shift-select</a> docstring (use <code>&lt;f1&gt; o</code> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | In most major modes, Emacs supports text selection by holding the Shift key down while moving point; this feature is called <a href="#">shift selection</a> . By default, shift selection is not available in org-mode; in org-mode the shift cursor keys are used to control the bullet state, titles and timestamps.<br>🔗 However, by you can customize <b>org-support-shift-select</b> to re-activate shift-selection completely (set it to <b>always</b> ) or partially (set it to <b>t</b> ) which activates shift-selection when the cursor is not in special context, and bullet cycling will only occur when point is exactly over the bullet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                         |

| You may also want to disable subscript for the current file by adding the following configuration line at the top of the Org file. That stops org-mode from turning underscores into subscripts unless you explicitly wrap text in curly braces like this: <code>_ {subscript}</code><br>Add the following entry at the very top of the file and then refresh the buffer by typing <b>C-c C-c</b> on that line after typing it: <b>#+OPTIONS: ^: { }</b>                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                         |

| Only affects the current buffer. Electric Pair mode is a global minor mode. When enabled, typing an open parenthesis automatically inserts the corresponding closing parenthesis, and vice versa. (Likewise for brackets, etc.). If the region is active, the parentheses (brackets, etc.) are inserted around the region instead.                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                         |

This method has the disadvantage, that the previous location will be folded, which may not be what you want.</li> <li>This command works around this by showing a copy of the current buffer in an indirect buffer, in overview mode. You can dive into the tree in that copy, use 'org-occur' and incremental search to find a location. When pressing RET or 'Q', the command returns to the original buffer in which the visibility is still unchanged. After RET it will also jump to the location selected in the indirect buffer and expose the headline hierarchy above.</li> </ul> |

With the default settings, no level adjustment takes place, but the yanked tree is folded unless doing so would swallow text previously visible. Any prefix argument forces a normal yank: a good way to force a normal yank is <b>C-u C-y</b>.</p> <ul style="list-style-type: none"> <li>If you use yank-pop after a yank, it yanks previous kill items plainly, without adjustment and folding.</li> </ul> Look at the current kill and check if is a single subtree, or a series of subtrees. If it passes the test, and if the cursor is at the beginning of a line or after the stars of a currently empty headline, then the yank is handled specially according to the value of the following user-option variables: <p><b>org-yank-folded-subtrees:</b><br/>By default, this variable is non-nil, which results in subtree(s) being folded after insertion, except if doing so would swallow text after the yanked text.</p> <p><b>org-yank-adjusted-subtrees:</b><br/>When non-nil (the default value is nil), the subtree will be promoted or demoted in order to fit into the local outline tree structure, which means that the level will be adjusted so that it becomes the smaller one of the two "visible" surrounding headings.</p> |
| Clone sub-tree                                                                                                                                                          | <b>C-c C-x c</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | ( <b>org-clone-subtree-with-time-shift</b> N &optional SHIFT) | Clone a subtree by making a number of sibling copies of it. Prompts for the number of copies to make; you can also specify whether any timestamps in the entry should be shifted. This can be useful, for example, to create a number of tasks related to a series of lectures to prepare. For more details, see the docstring of the command org-clone-subtree-with-time-shift                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

With prefix arg N, jump back that many stored positions. When called several times in succession, walk through the entire ring. Org mode commands jumping to a different position in current file, or to another Org file, automatically push old position onto the ring.                                                                                                                                                                                           |

This command can create sparse trees. You first need to select the type of match used to create the tree:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                                                                  | • Once a scheduled task is marked done it will still be listed on that date, unless you set the <b>org-agenda-skip-scheduled-if-done</b> user-option.<br>• In Org mode, a scheduled item represents a "do-date" to start working on a task, which rolls over daily in the agenda until completed, whereas a plain timestamp denotes a fixed appointment or event. A scheduled task acts as a reminder for action, while a timestamped event merely indicates a specific point in time. For instance, a project report would be marked with <b>SCHEDULED: &lt;date&gt;</b> to begin work, while a team meeting would use a plain timestamp ( <b>&lt;date&gt;</b> ) to mark a singular event.                                                                                 |                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                         |                            |          |                                        |            |                                  |          |                                             |          |                          |          |

| <b>Capture</b><br>• <a href="#">Using capture</a>                | Capture lets you quickly store notes with little interruption of your work flow.<br>• <b>Captured text</b> is stored in the file identified by <b>org-default-notes-file</b> user-option; it defaults to <b>~/ .notes</b> .<br>• Once text is captured in the note file, you can refile it inside the locations identified by <b>org-refile-targets</b> user-option (use <b>&lt;f11&gt; M-o &lt;f4&gt; r</b> to access it).                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                         |                            |          |                                        |            |                                  |          |                                             |          |                          |          |
| Capture something into the Org notes file.                       | <b>&lt;f11&gt; M-o c</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | ( <b>org-capture</b> &optional GOTO KEYS)                                                                                                                                             | Select a template from 'org-capture-templates', and then file the newly captured information. The text is immediately inserted at the target location, and an indirect buffer is shown where you can edit it. Pressing <b>'C-c C-c'</b> brings you back to the previous state of Emacs, to continue your work.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                         |                            |          |                                        |            |                                  |          |                                             |          |                          |          |
|                                                                  | • With a <b>'C-u'</b> prefix argument GOTO: don't capture anything, just go to the file/headline where the selected template stores its notes.<br>• With a <b>'C-u C-u'</b> prefix argument: go to the last note stored. When called with a <b>'C-0'</b> (zero) prefix, insert a template at point.<br>• When called with a <b>'C-1'</b> (one) prefix, force prompting for a date when a datetree entry is made.<br>• Instead of Control key for numerical prefixes you can also use the Meta key.<br>If <b>'org-capture-use-agenda-date'</b> is non-nil, capturing from the agenda will use the date at point as the default date. Then, a <b>'C-1'</b> prefix will tell the capture process to use the HH:MM time of the day at point (if any) or the current HH:MM time. |                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                         |                            |          |                                        |            |                                  |          |                                             |          |                          |          |
